# Contents

- Nuclear emulsion
- NINJA experiment

# What is Nuclear Emulsion ?

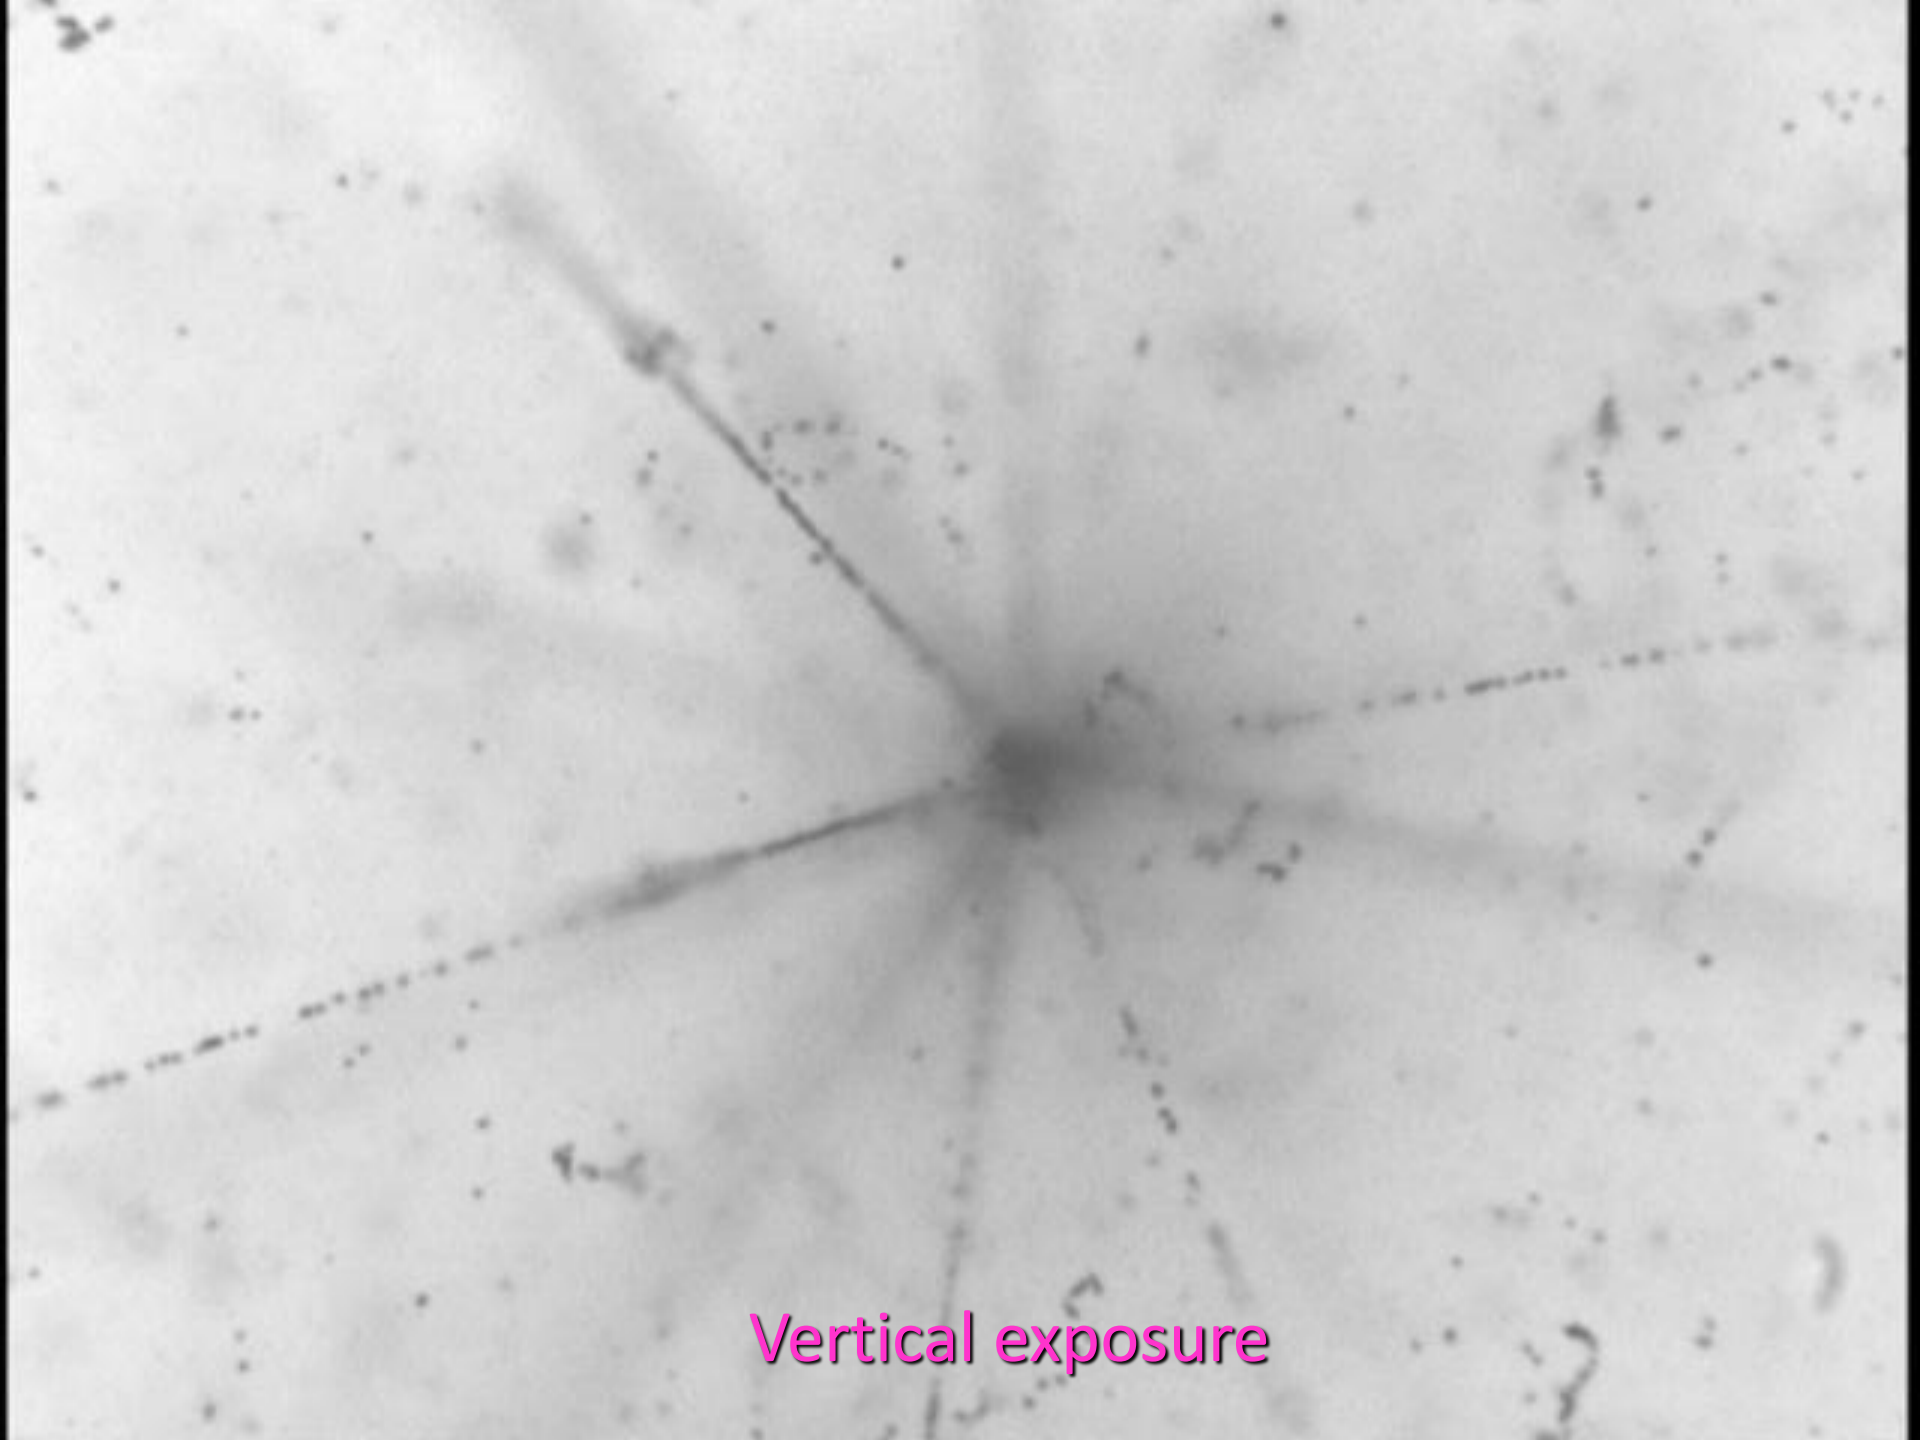

Microscopic image

High energy  
heavy ion beam

$100\mu\text{m} = 0.1\text{mm}$

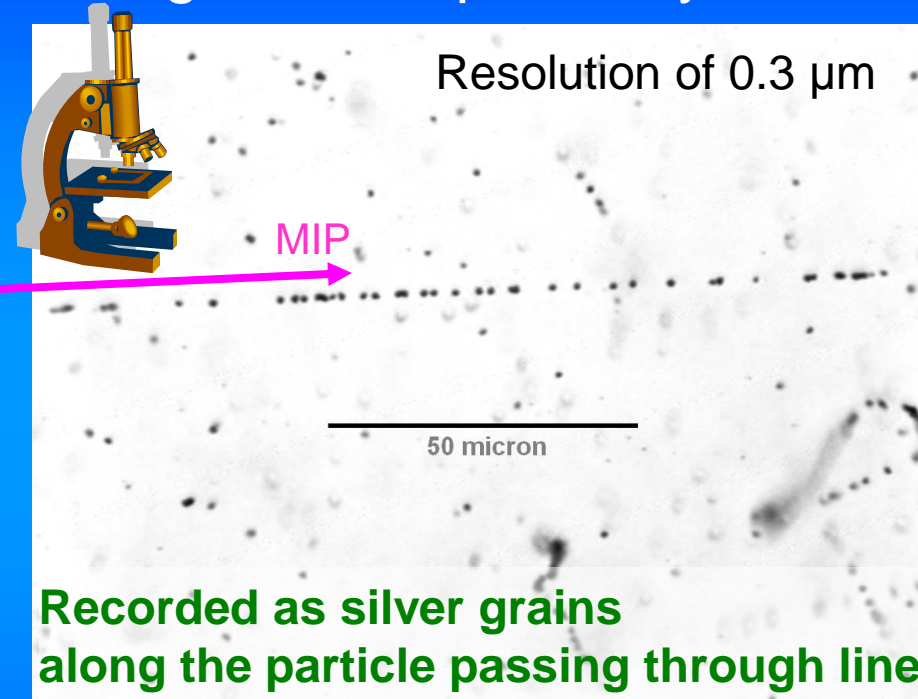

3D tracking detector with submicron position accuracy

Vertical exposure

# Photographic Film technology

- Nuclear Emulsion is a special photographic film.
- Signal is amplified by chemical process.

	Merit	Image detection
Film camera	<b>High resolution</b>	Sliver halide (Photochemical reaction)
Digital camera	Real time	CCD, CMOS (Photoelectric conversion)

Largest Digital Camera  
ATLAS detector  
( $\sim 1.6 \times 10^8$  image sensors)

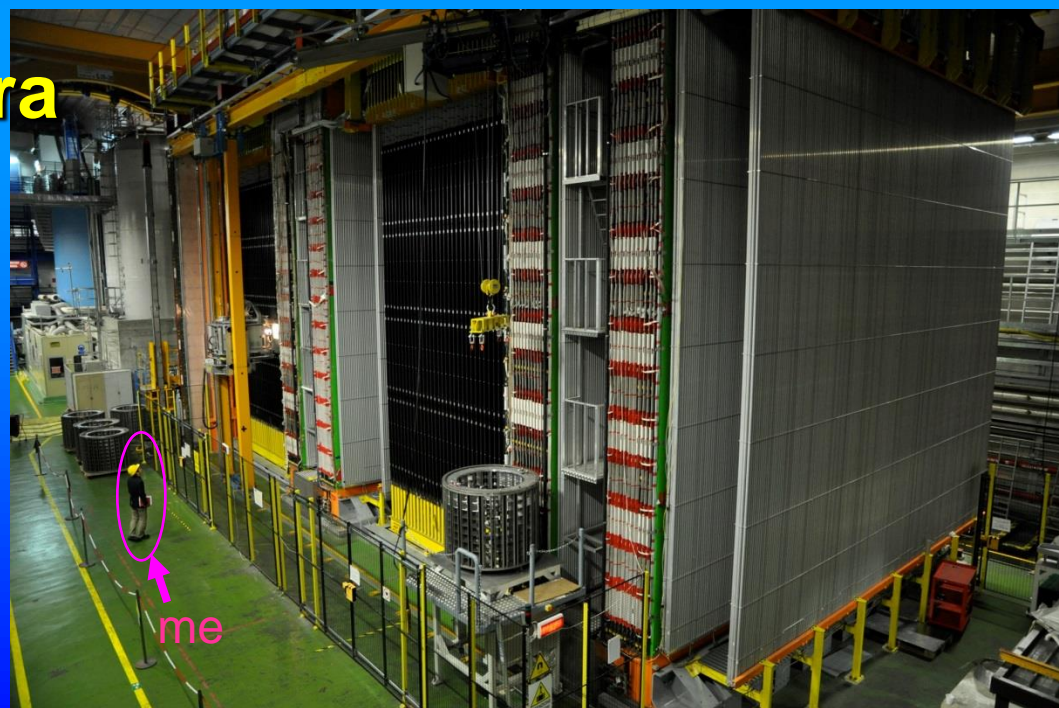

**Largest Film Camera**

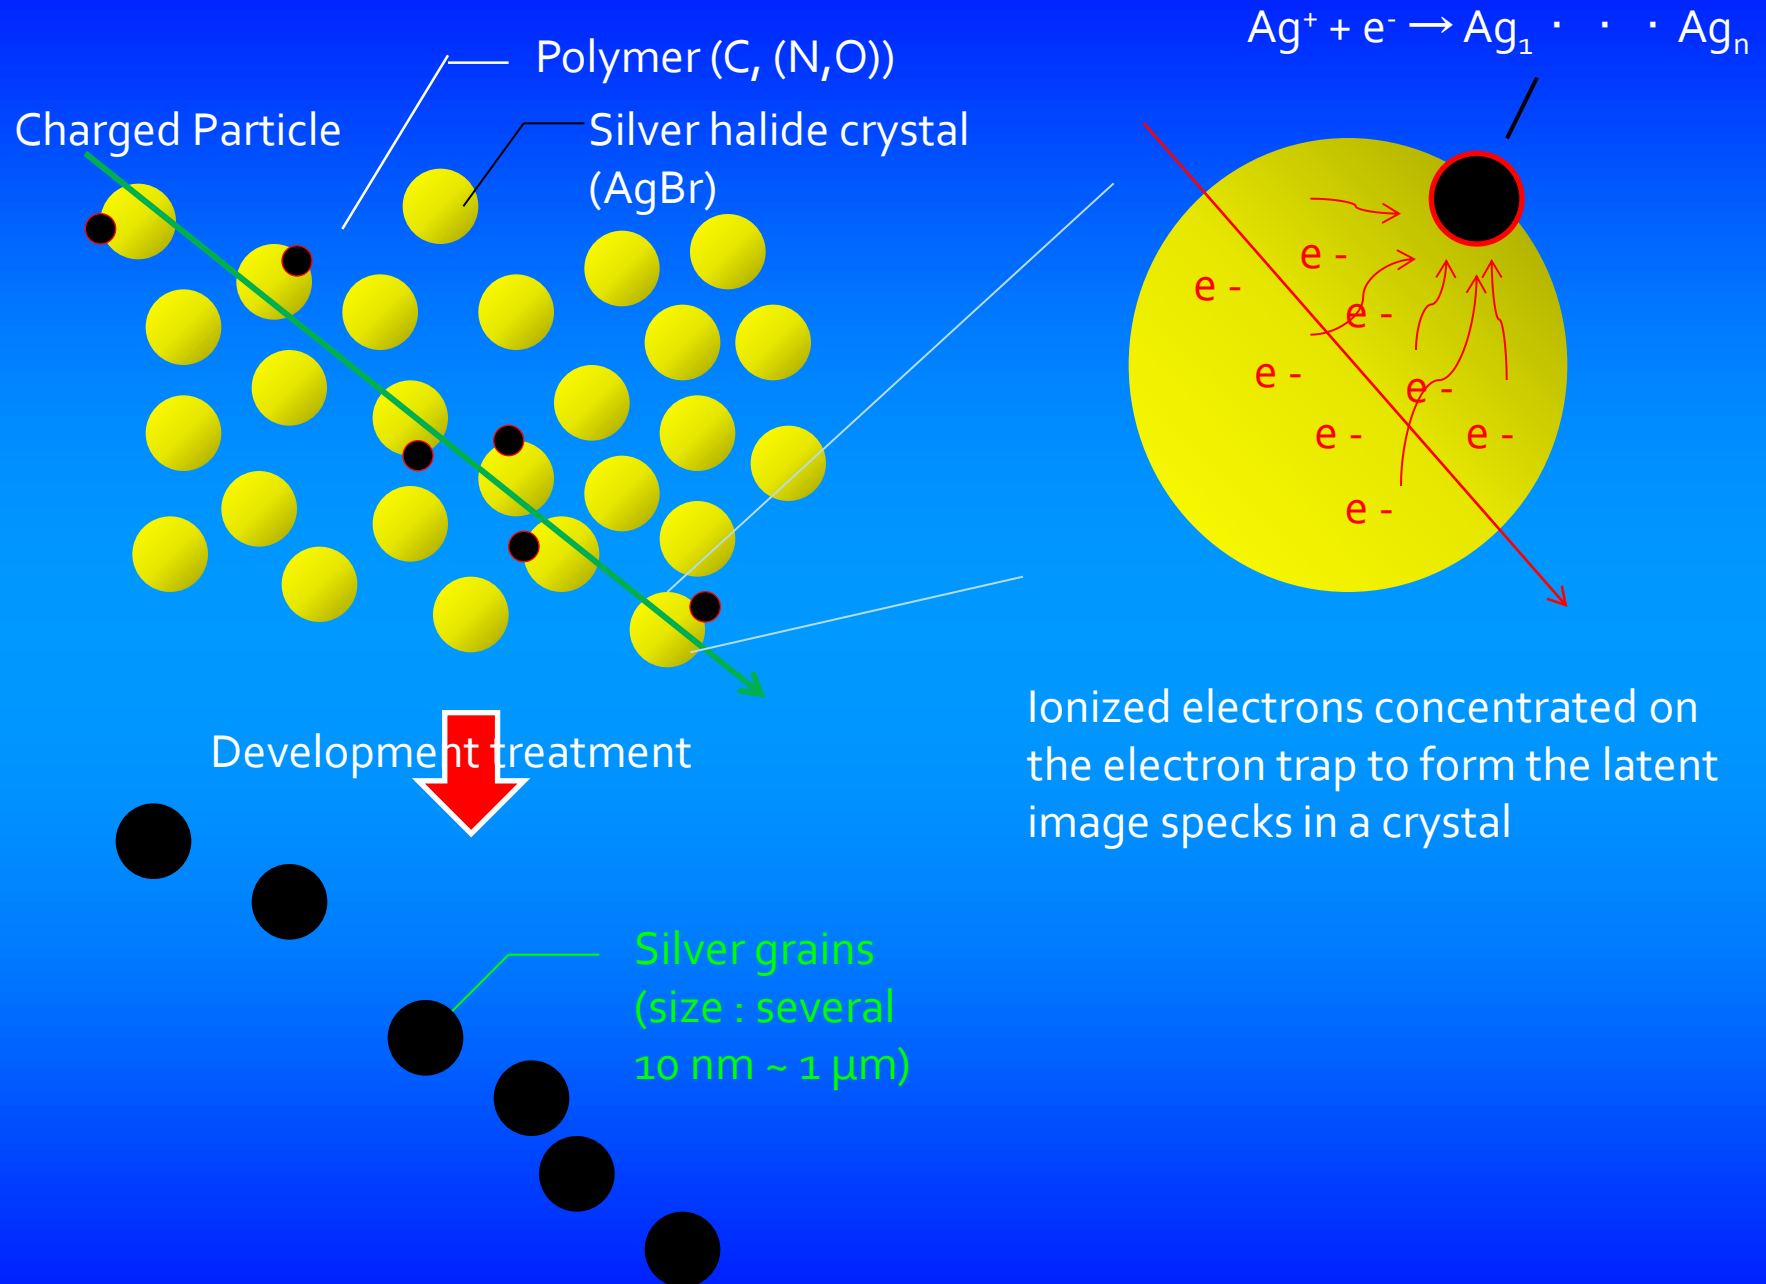

OPERA detector  
( $\sim 10^{20}$  AgBr crystals)

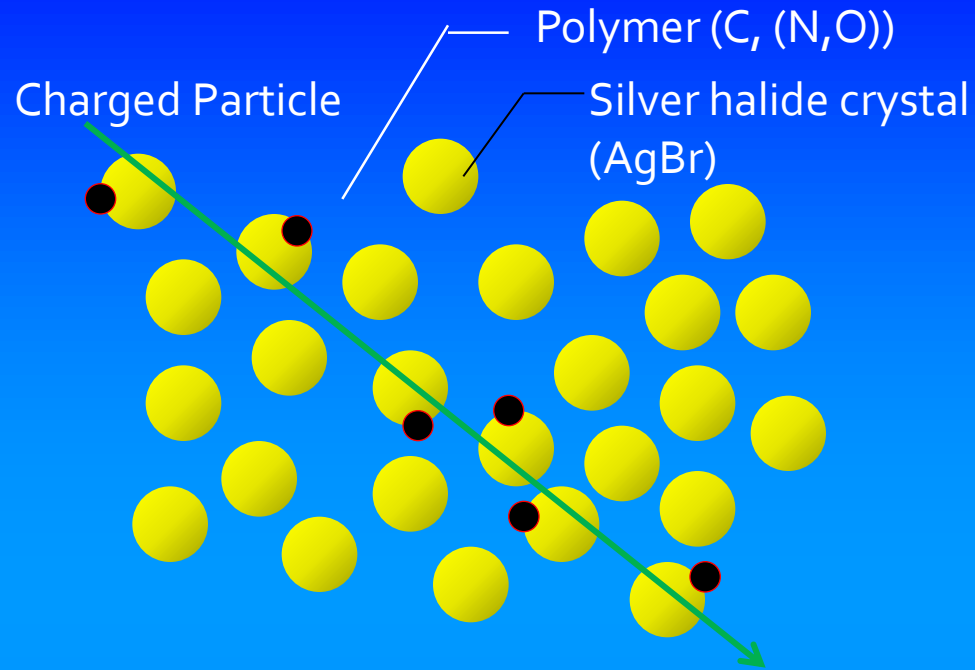

9000,000 emulsion films

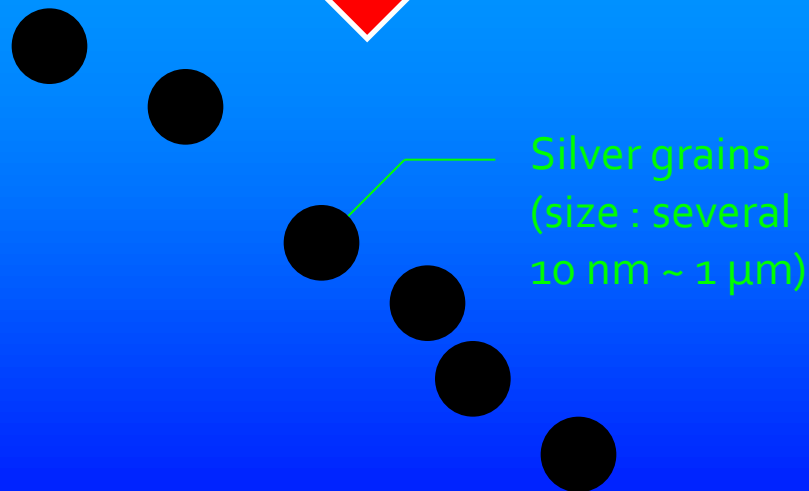

# Nuclear Emulsion Detector

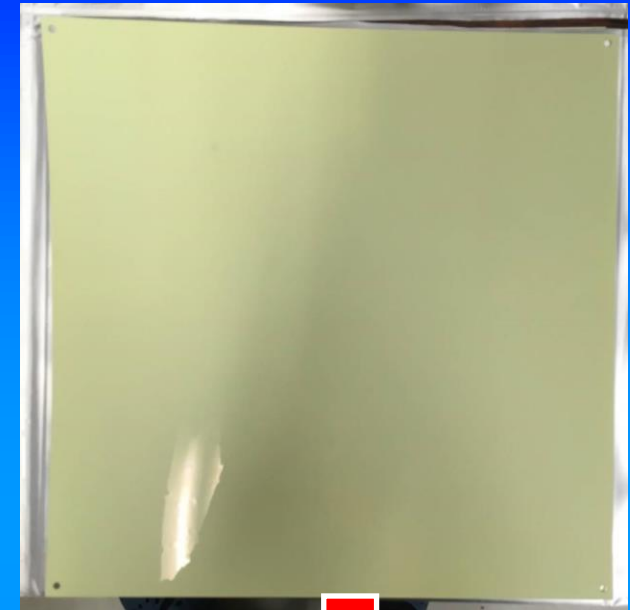

# Nuclear Emulsion Detector

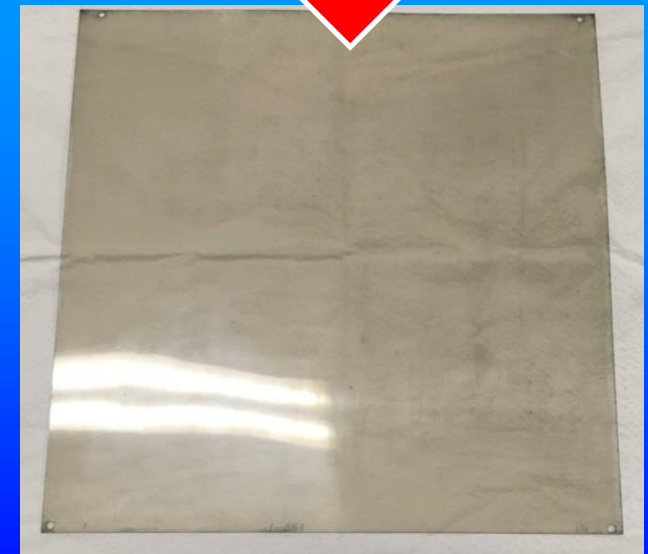

Development treatment

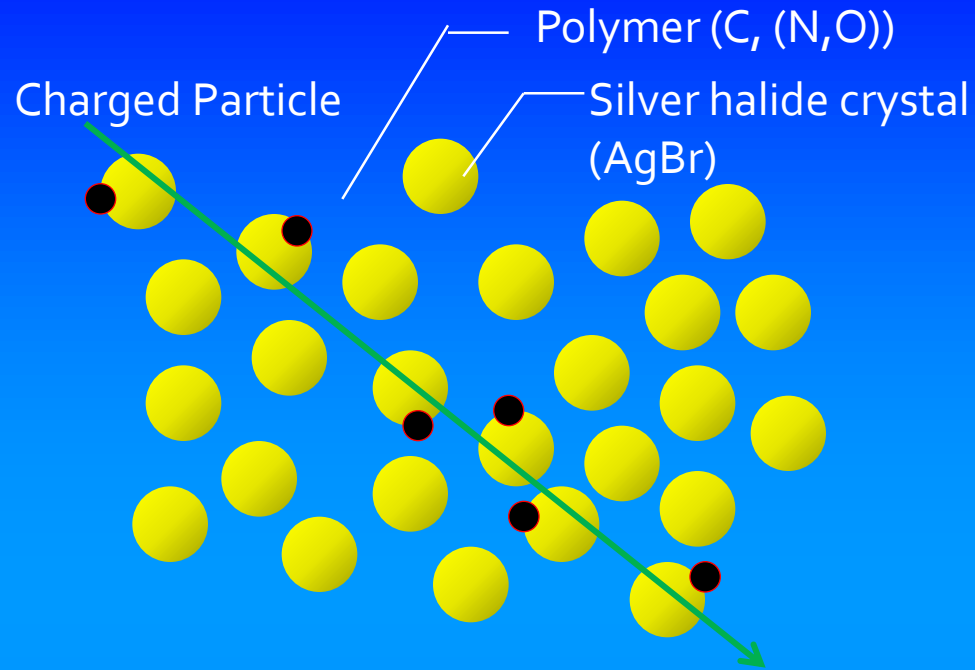

Emulsion film

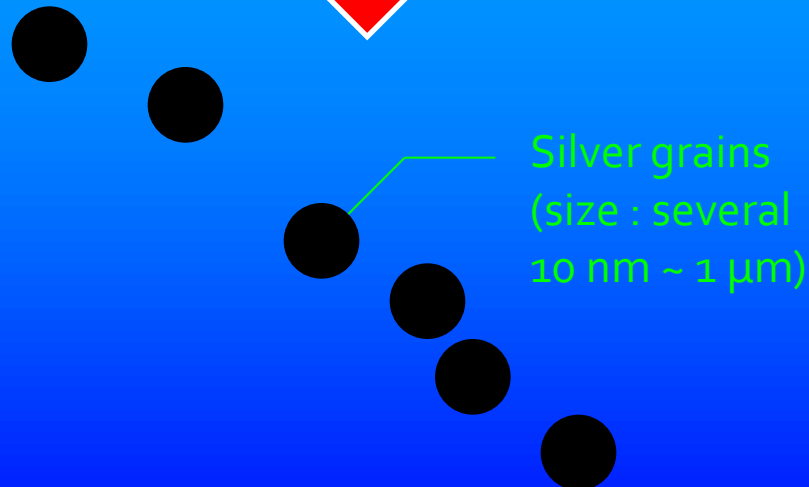

Development treatment

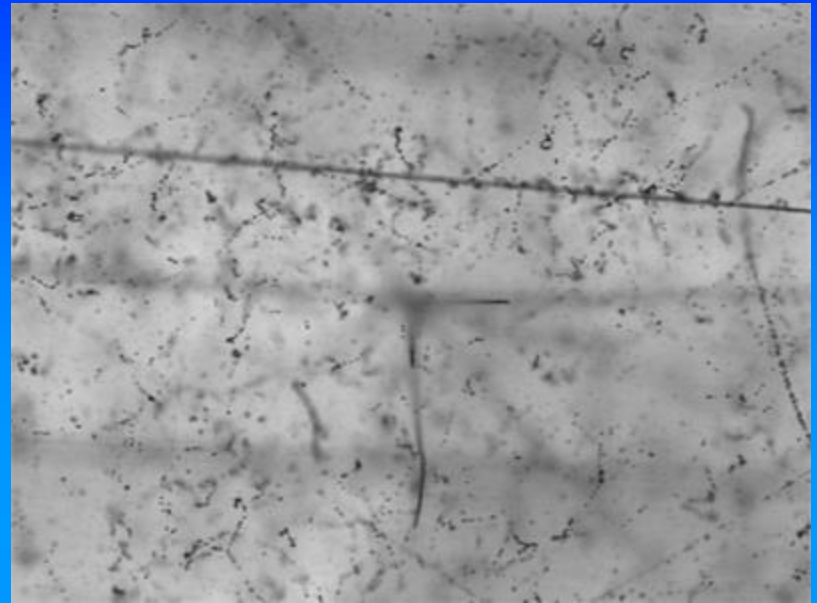

# Nuclear Emulsion Detector

Development treatment

Nuclear spallation reaction by heavy ion

100 μm

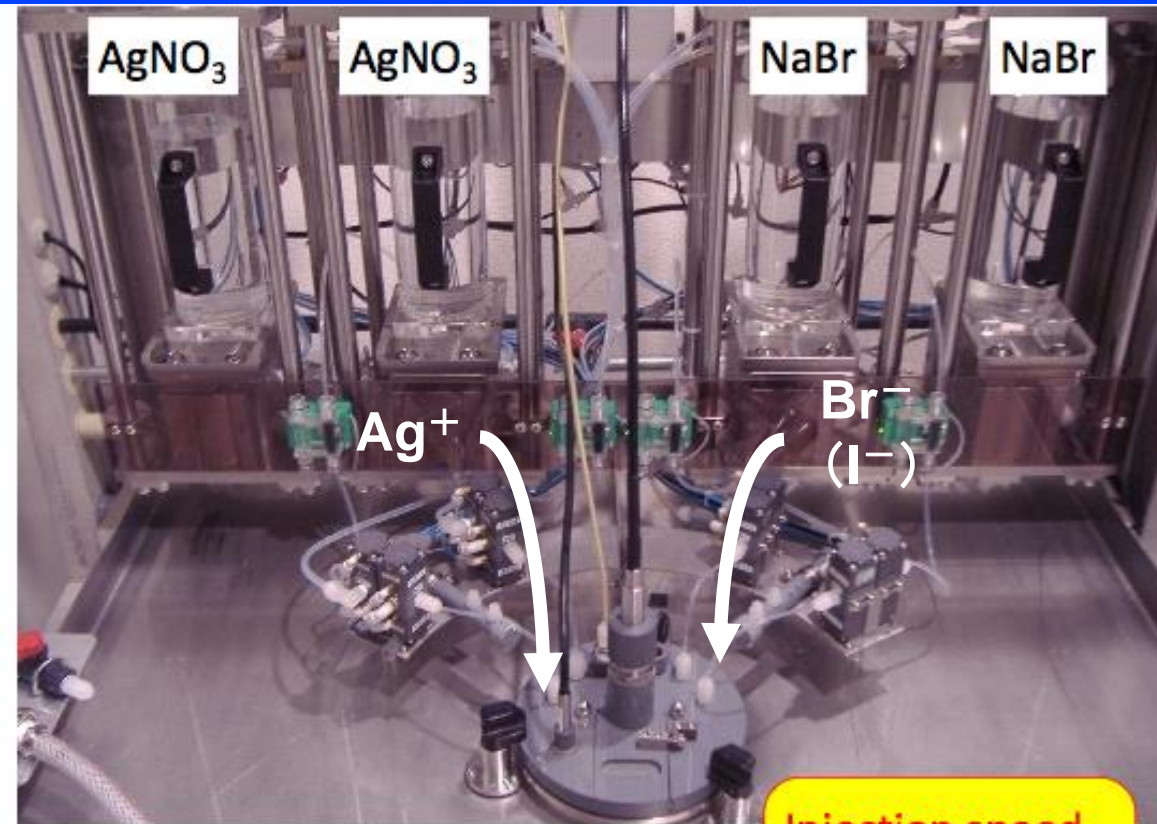

Spatial resolution

- silver halide crystal size
- number density of silver halide crystal

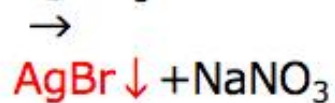

Sensitivity

- Chemical treatment
- Crystal defect and doping etc.

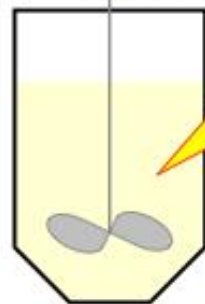

# Production of emulsion gel

Chemical reaction

**Chemical process**

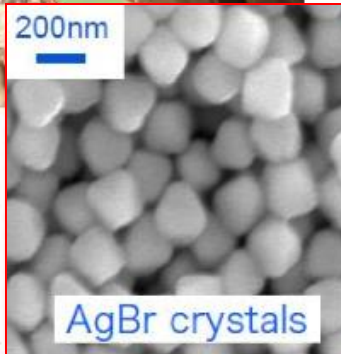

Injection speed  
Mixing speed  
Temperature

Crystal size  
Crystal shape

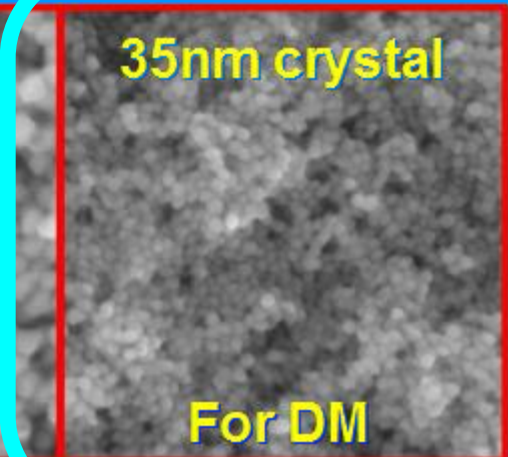

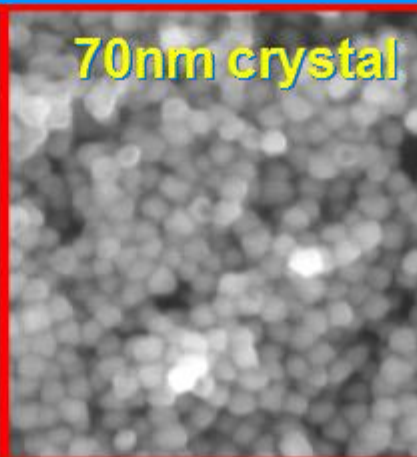

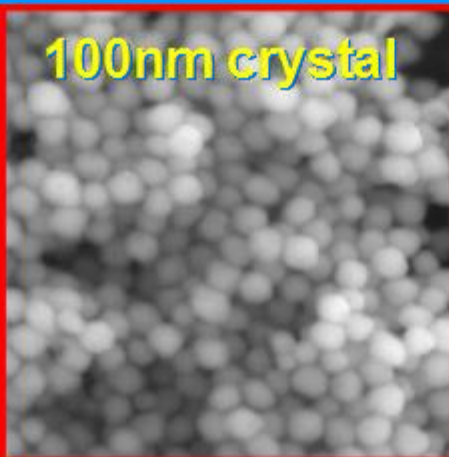

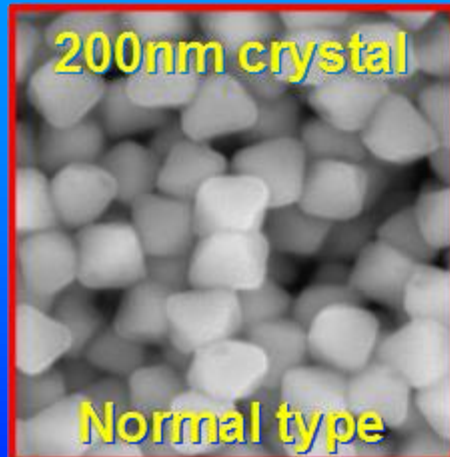

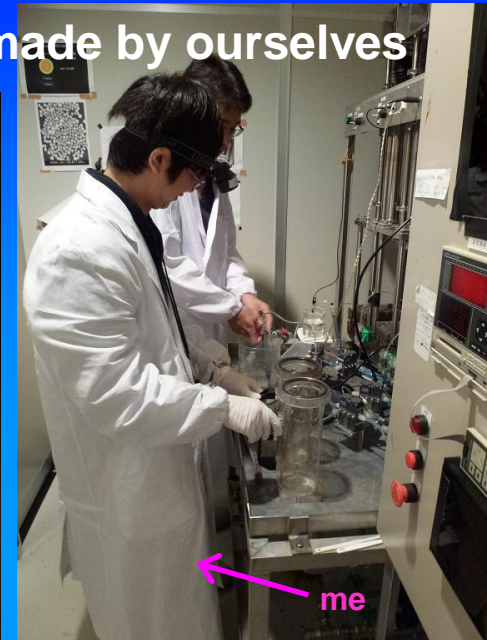

chemical

Sensitivity  
Stability

# Production of emulsion gel

Nuclear emulsion gel is made by ourselves

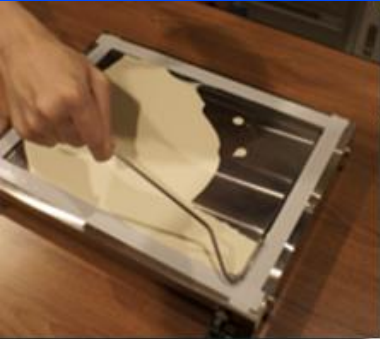

500 nm

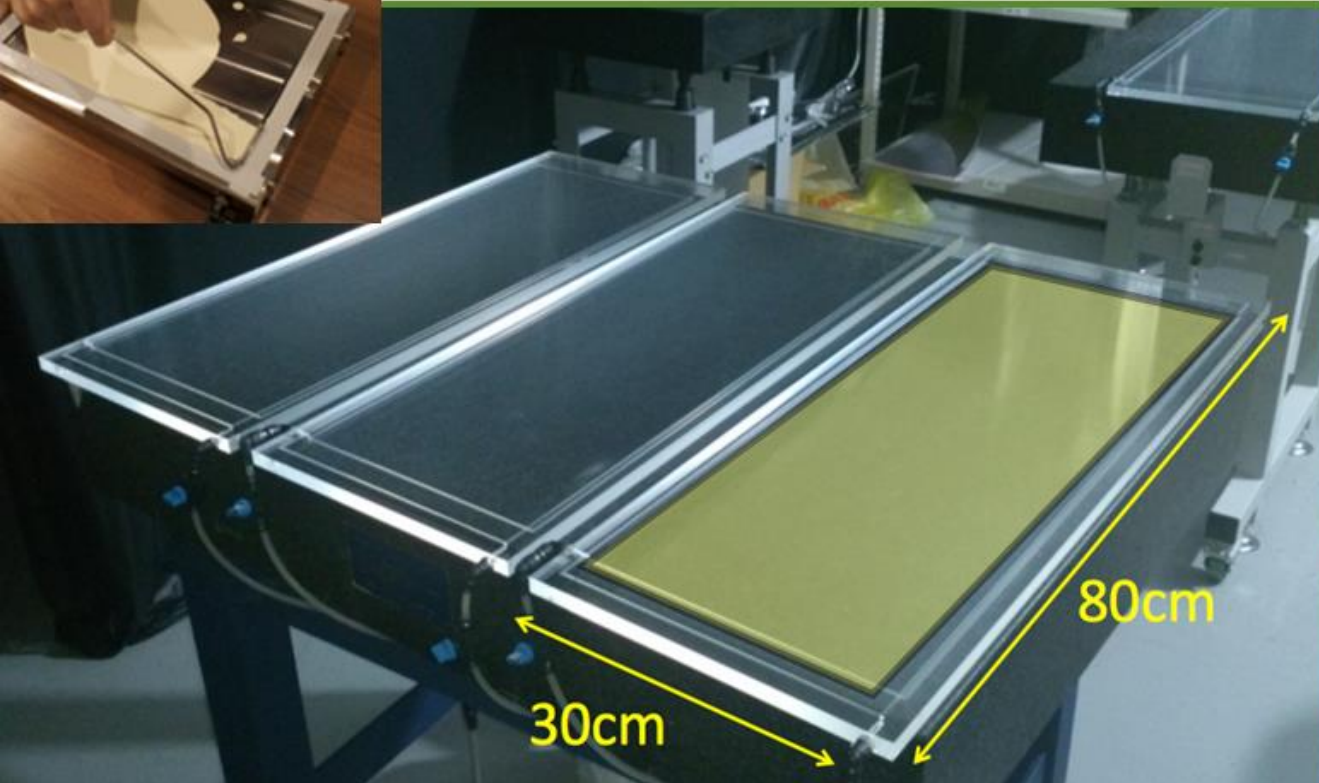

Electronic microscope image

size control

# Emulsion film production in the lab

**Pouring:** Temp. 20°C, R.H. 80-90%

**Drying:** Temp. 30°C  
R.H. 70-80%

Gel melting

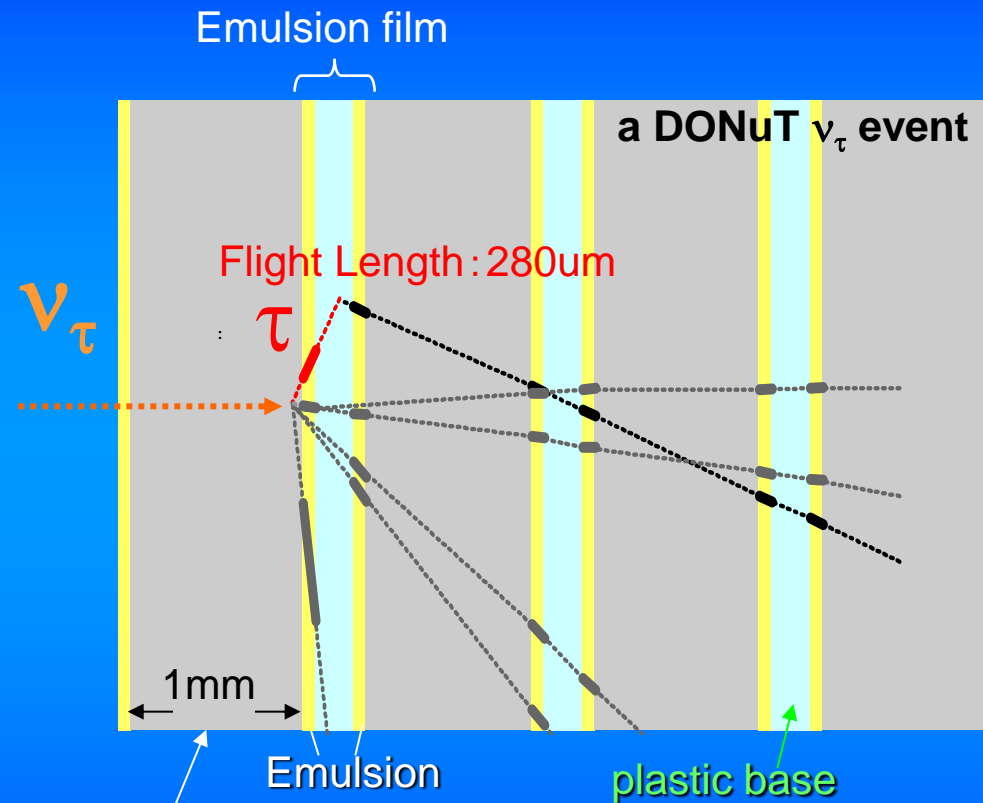

Pouring

Drying

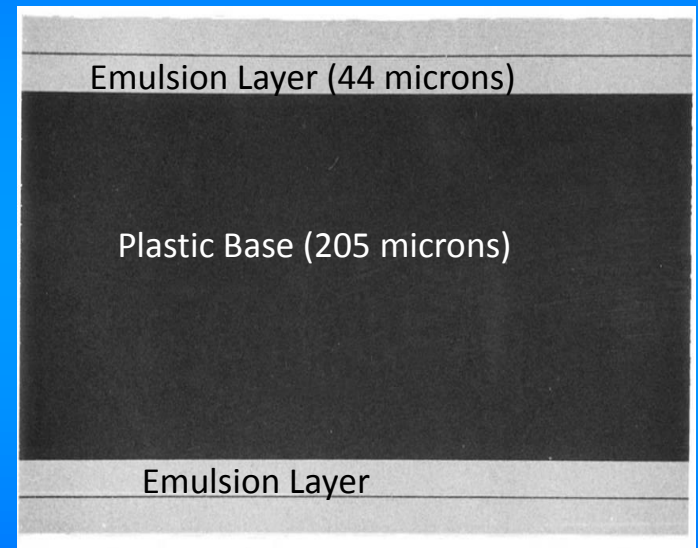

Currently an automatic pouring and drying system is developed.

# Emulsion Cloud Chamber (ECC)

DONuT : Iron 1mm  
 OPERA : Lead 1mm  
 NINJA : Iron 0.5mm, Water 2.3mm

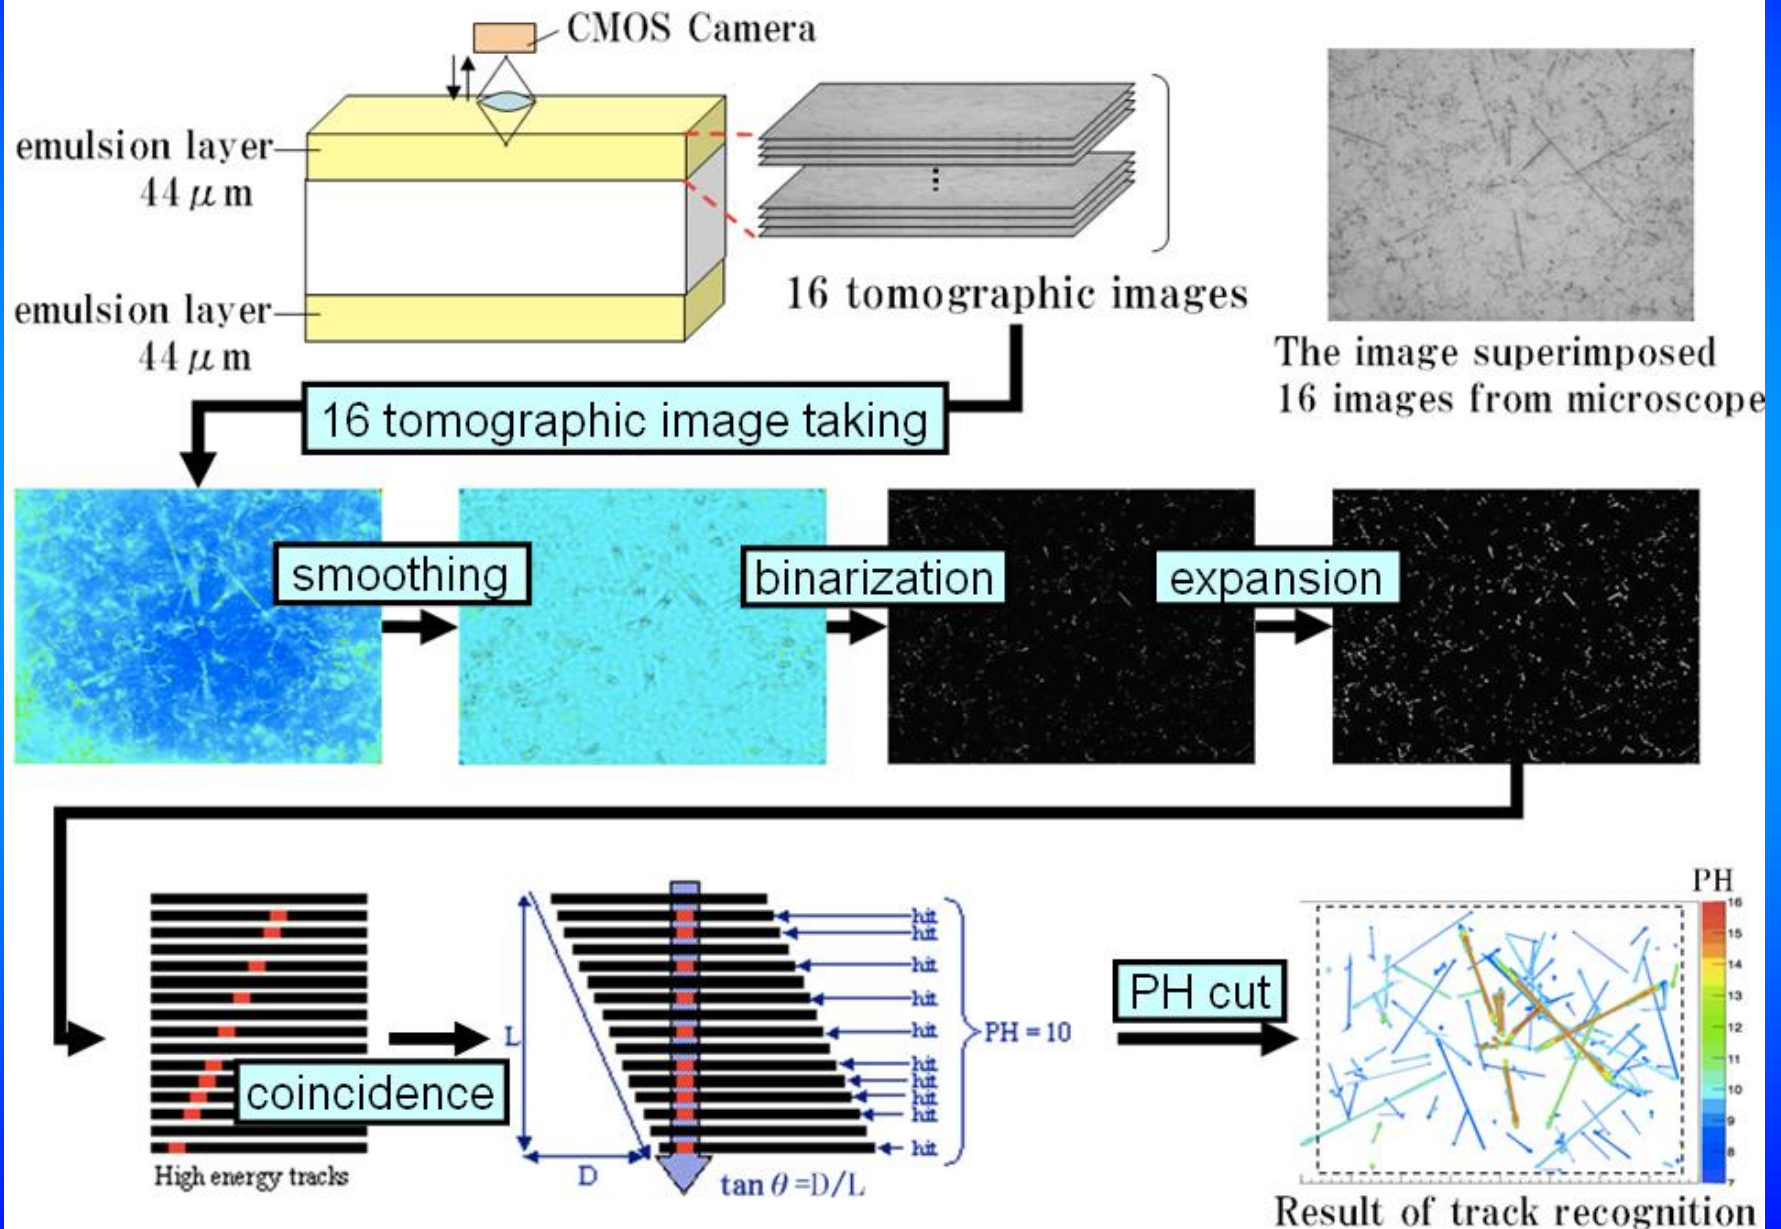

basic detector: AgBr crystal,  
 size = 0.2 micron  
 detection eff.= 0.16/crystal  
 **$10^{13}$  “detectors” per film**

44-70μm emulsion gel were coated  
 on both sides of the ~200μm-thick  
 plastic base.

Sandwich structure of emulsion films and target material.

# Automatic track recognition

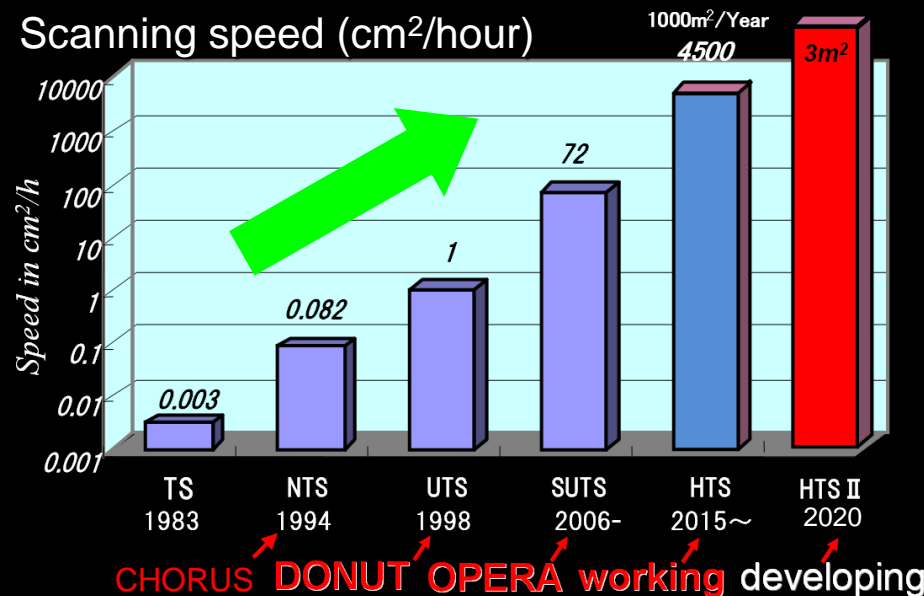

# Hyper Track Selector

Camera:  
2MP 72 sensors

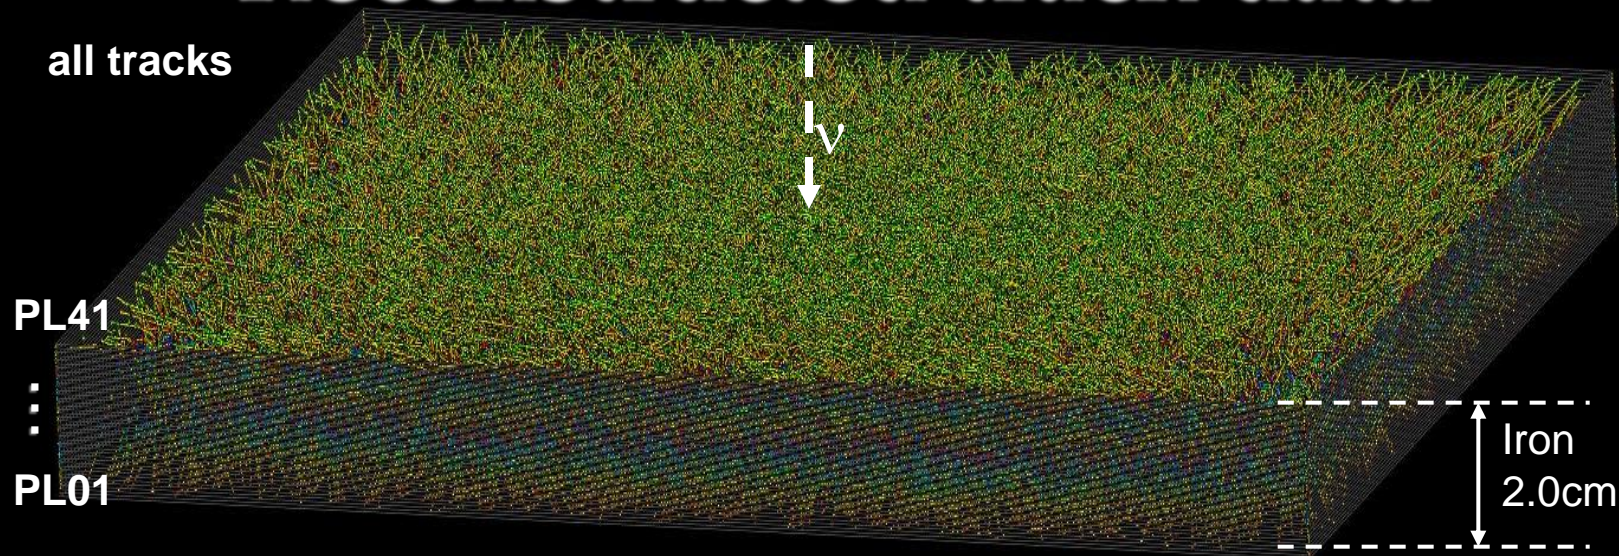

Image processing:  
72 GPUs in 36 PCs

Lenz:  
FOV 25mm<sup>2</sup>

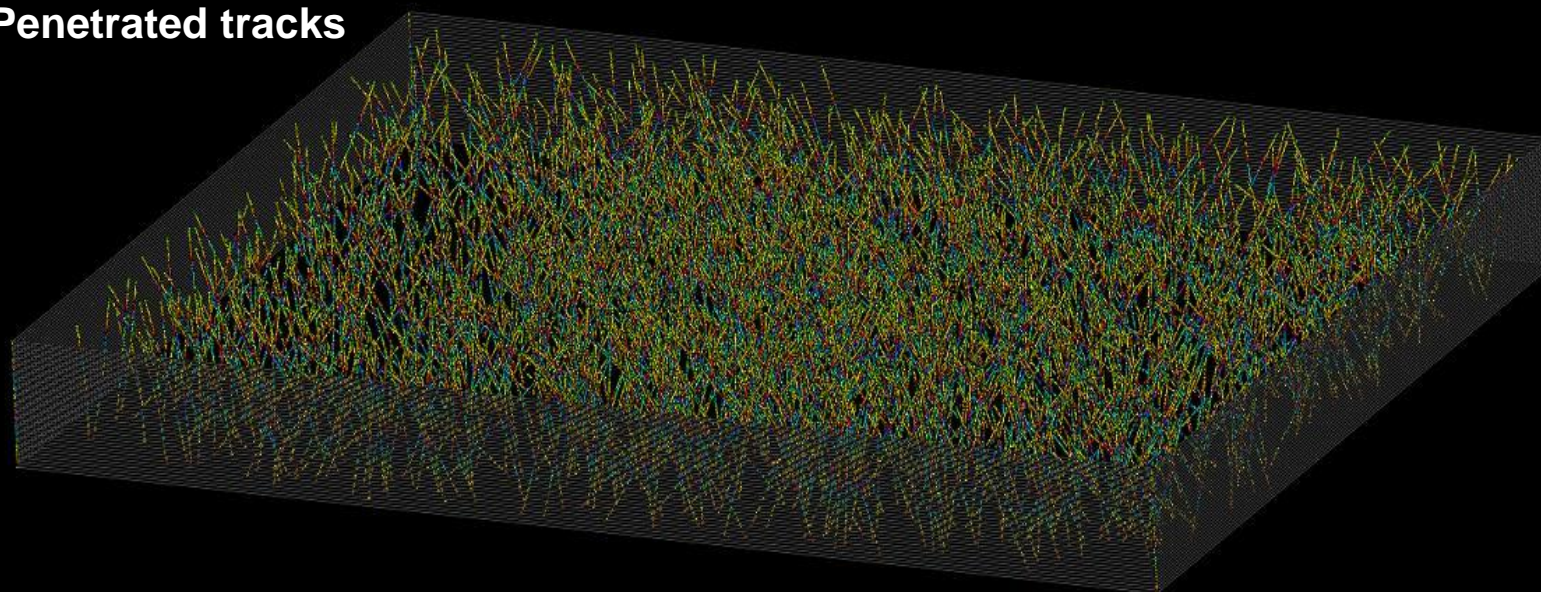

Emulsion film  
25x38 cm<sup>2</sup> or 25x25cm<sup>2</sup>  
**1~1.5 hours**

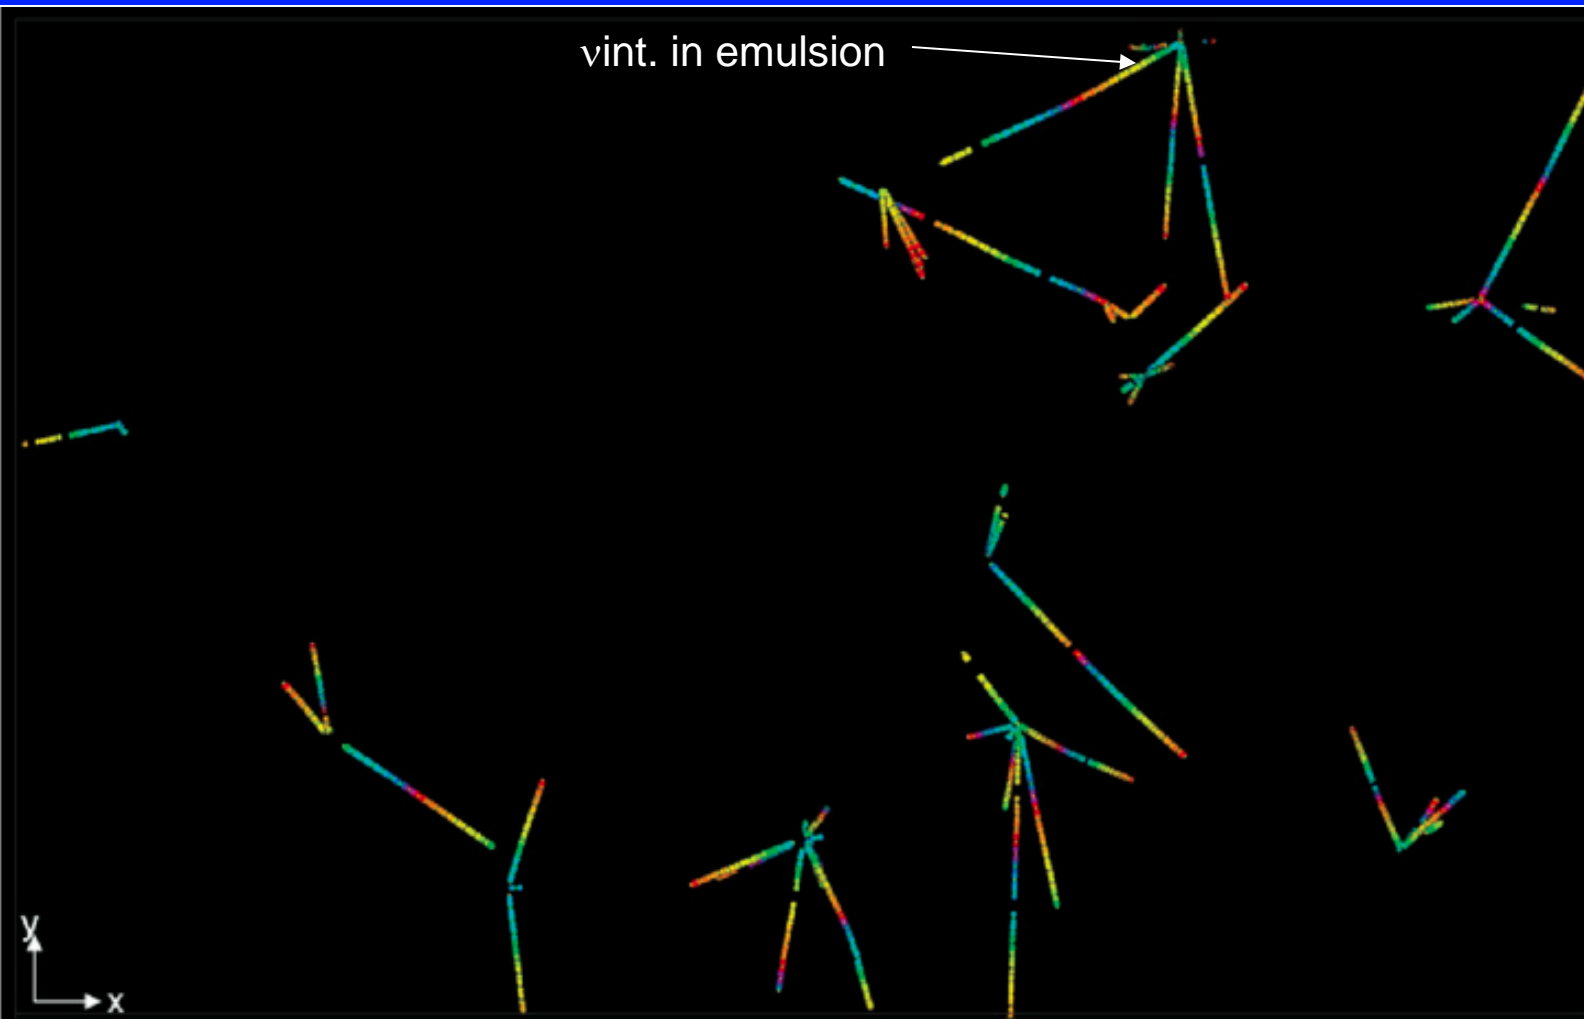

# Reconstructed track data

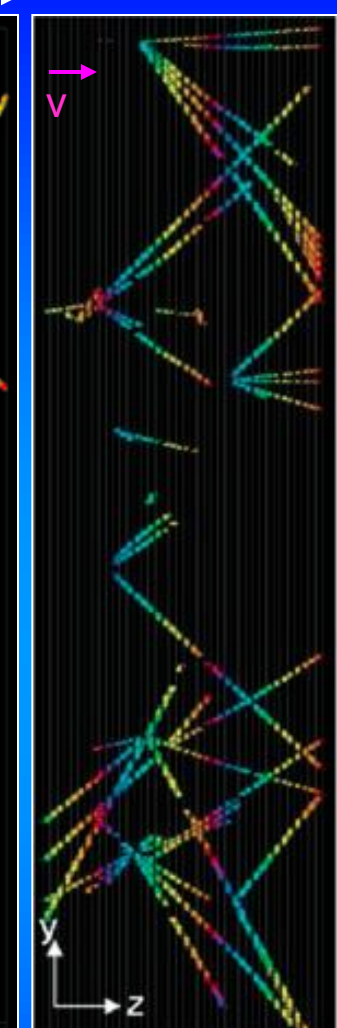

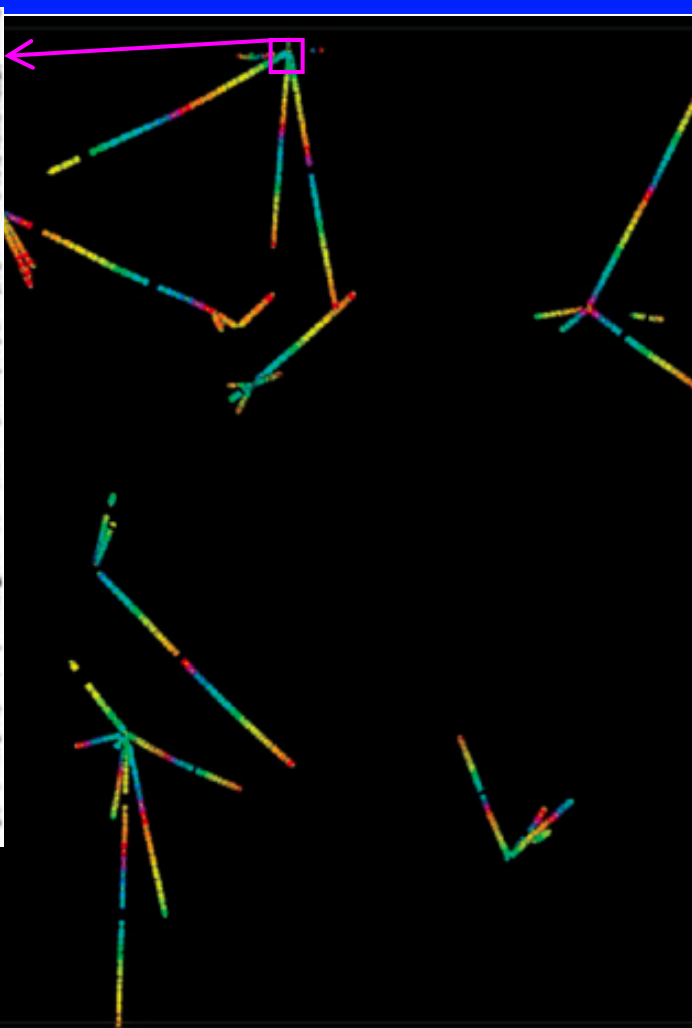

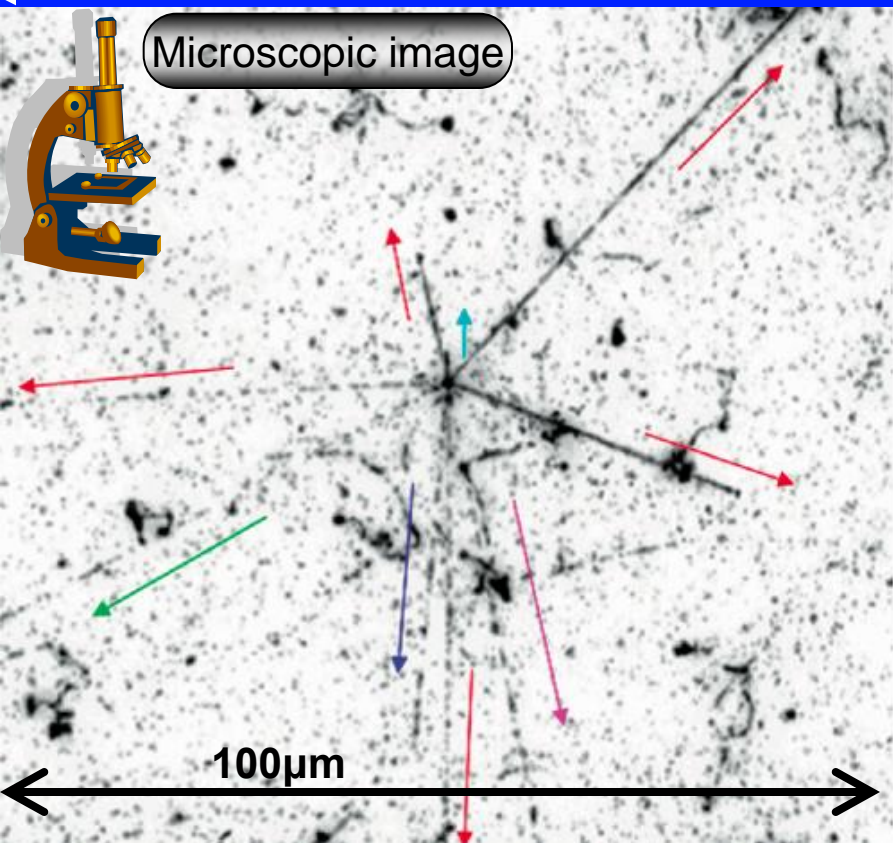

Penetrated tracks

12.3cm

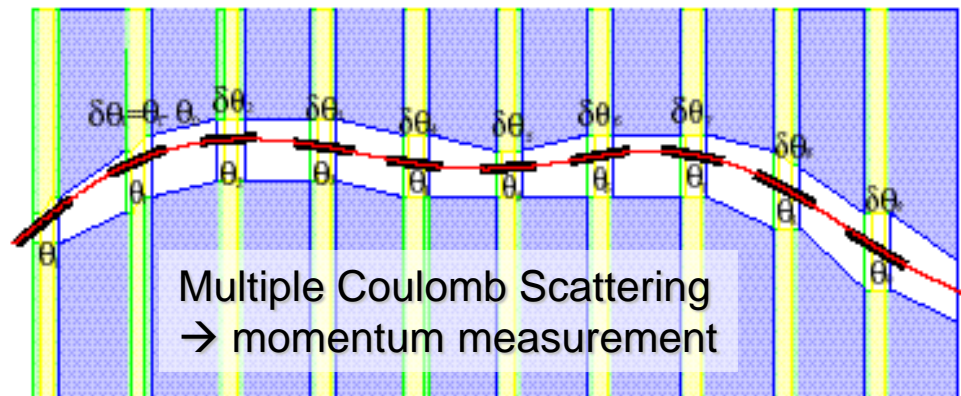

12.3cm

Iron 2.0cm

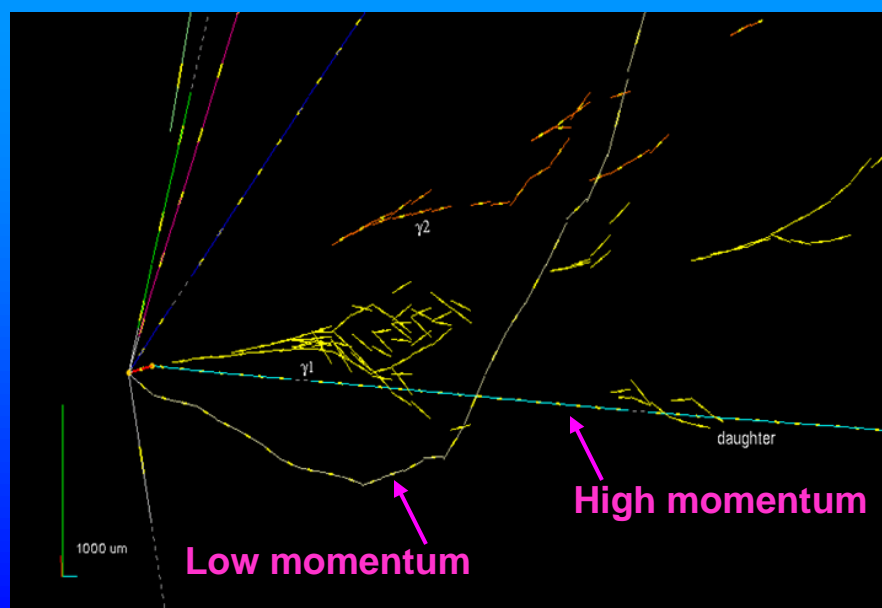

# Momentum measurement

pβ measurement by the MCS method

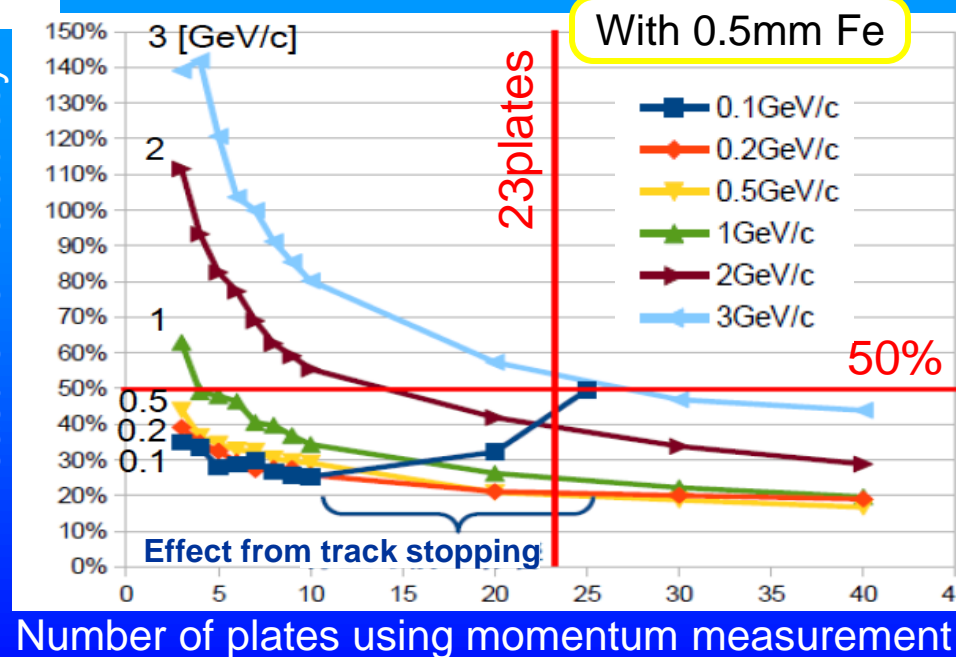

$$P\beta = \frac{13.6 \text{ (MeV/c)}}{\sigma_{\delta\theta}} \sqrt{\frac{X}{X_0}} \left( 1 + 0.038 \ln \frac{X}{X_0} \right)$$

MC study by GEANT4

Measurement accuracy

# Proton identification

$dE/dx$  measurement by track blackness

Proton (0.40 GeV/c)

20  $\mu$ m

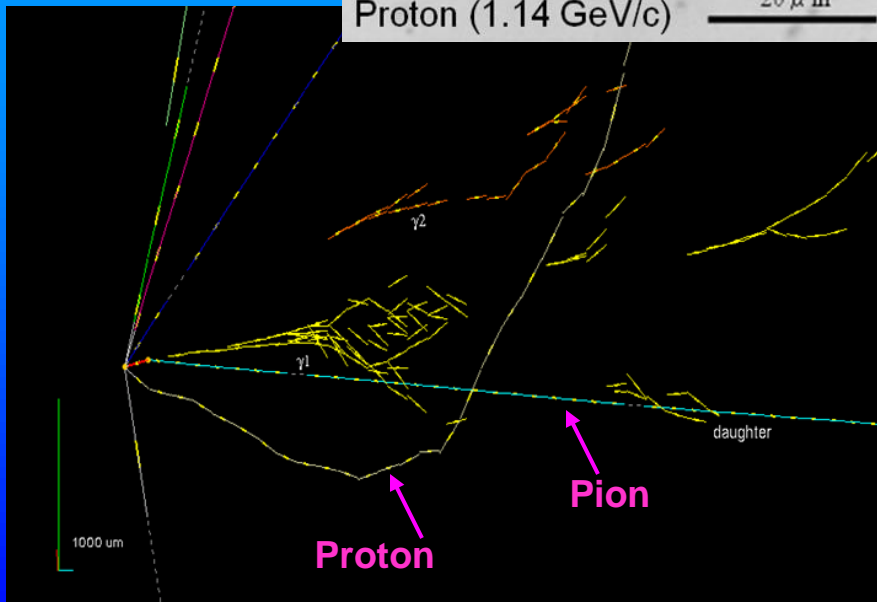

Proton (0.60 GeV/c)

Proton (0.74 GeV/c)

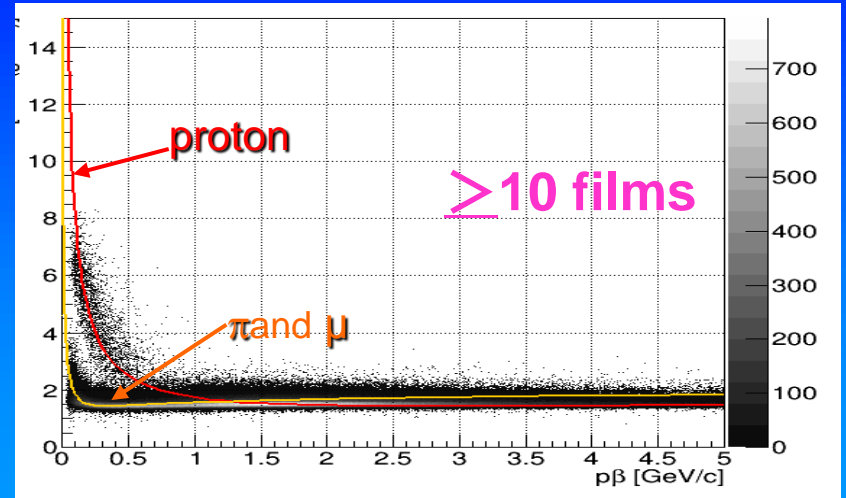

20  $\mu$ m

Proton (1.14 GeV/c)

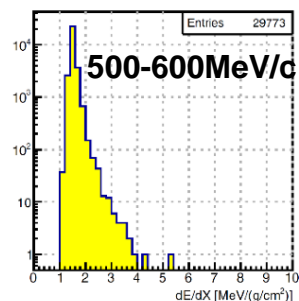

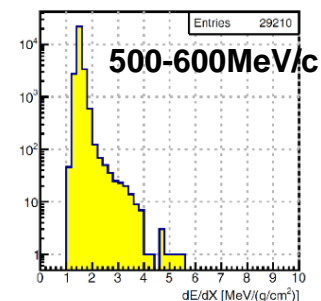

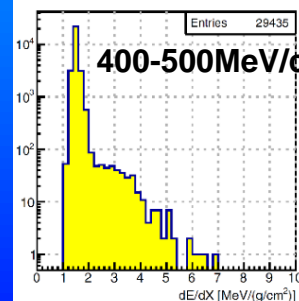

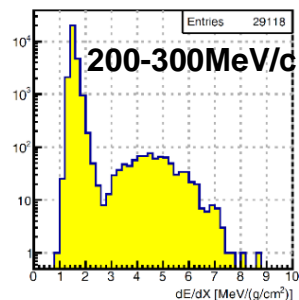

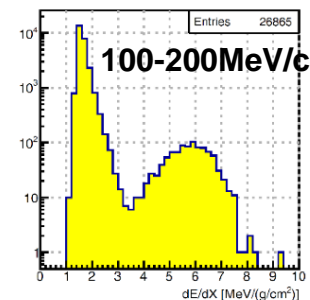

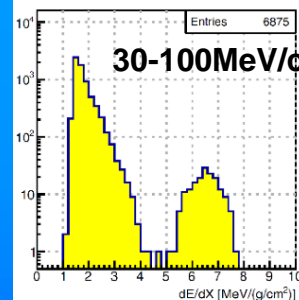

20  $\mu$ m

Blackness of Track =  $dE/dx$

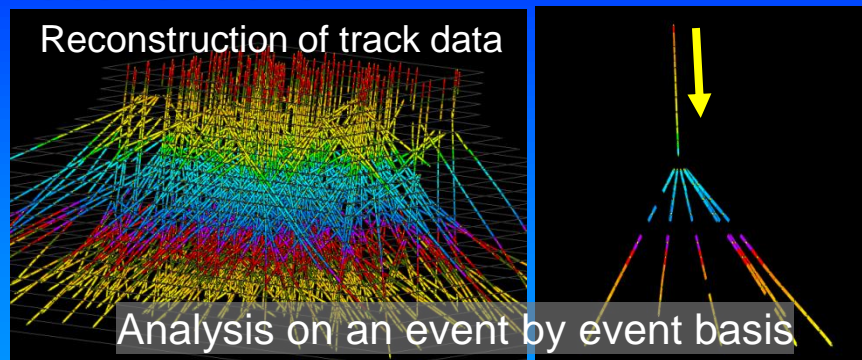

Momentum  $p\beta$  (GeV/c)

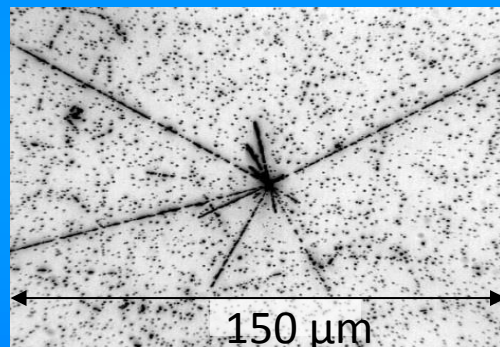

More emulsion films, better separation

# Nuclear Emulsion Detector

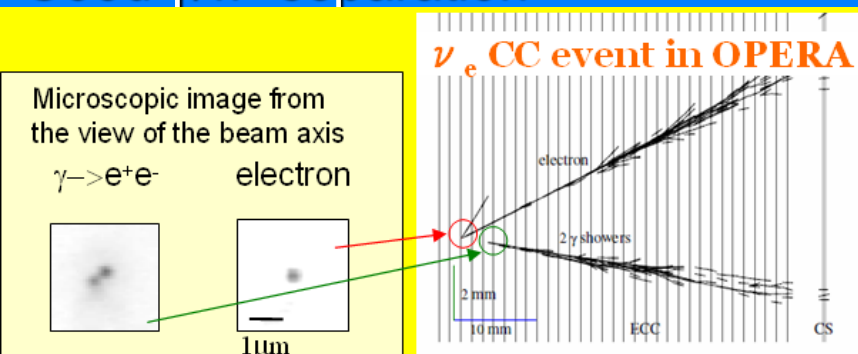

## 3D reconstruction

## 4 $\pi$ detection

## Good $\gamma/\pi^0$ separation

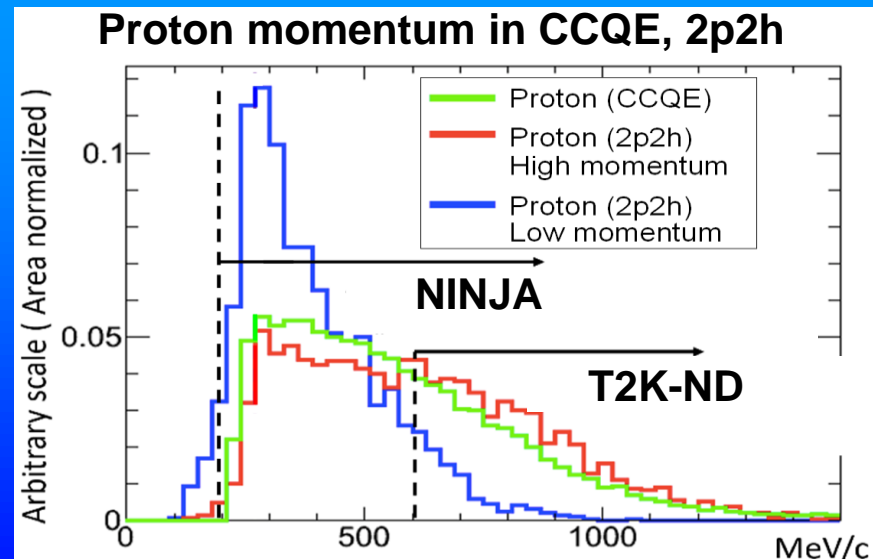

Low BG from  $\nu_\mu$  NC  $\pi^0$  production

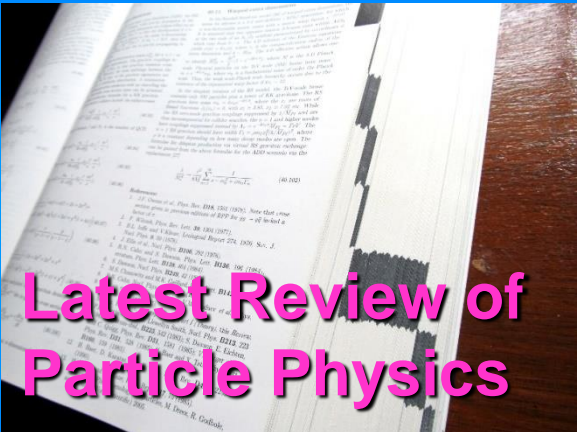

## Scalability

## Low energy threshold

# Detector list of accelerator-based neutrino experiment

Latest Review of  
Particle Physics

# Physics Motivation

## Sub-Multi GeV Neutrino interaction

- Major source of uncertainty in  $\nu$  oscillation analysis
- $\nu_e$  anomaly from several experiments (sterile  $\nu$  ?)

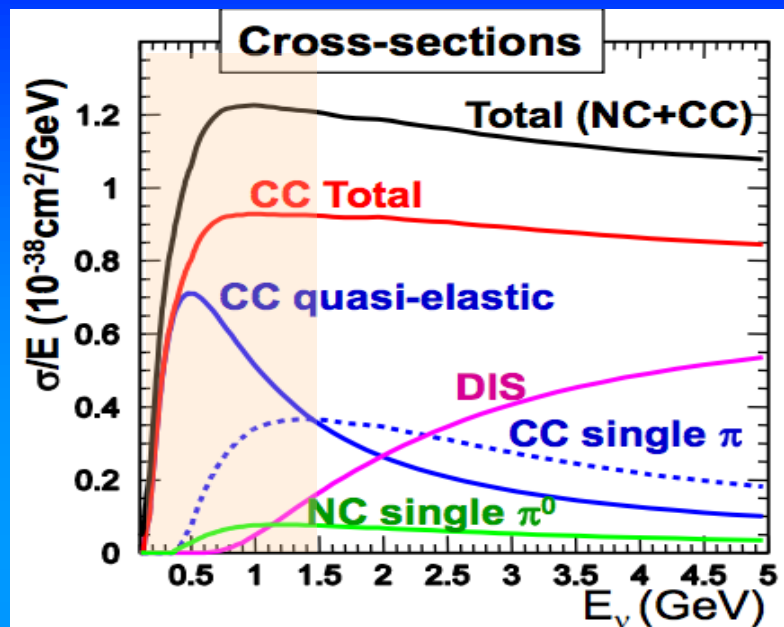

**Need to more understand the neutrino-nucleus interaction !**

- Confirmation and cross-section measurement of 2p2h int.
- Exclusive measurement of  $\nu_\mu$ ,  $\nu_e$ - water cross-sections

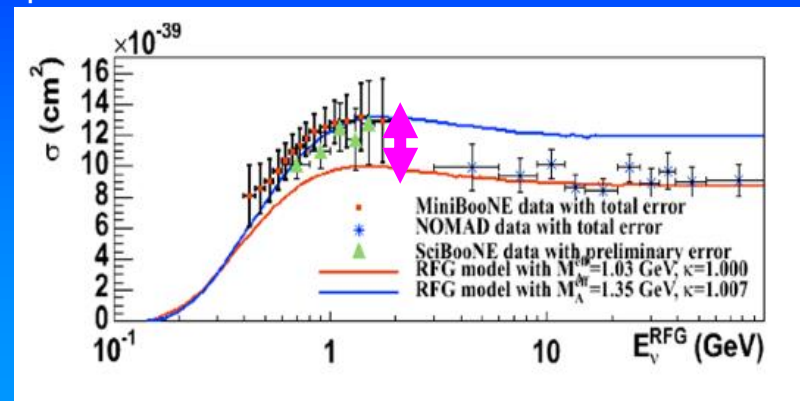

Effect from Sterile Neutrino ?

# Low energy neutrino interactions

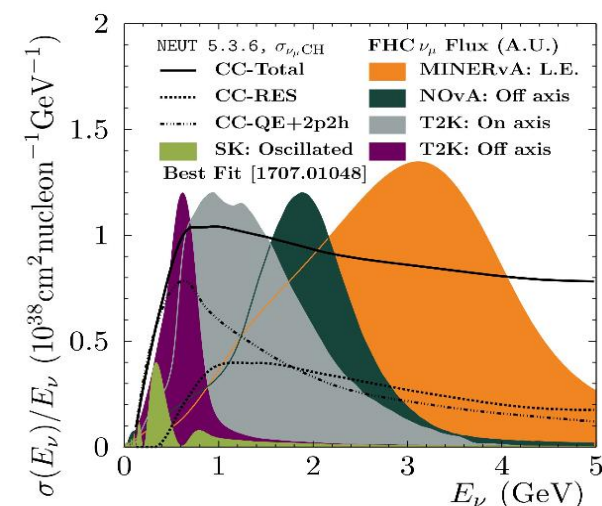

$\nu_\mu$ -Carbon CCQE like cross-section

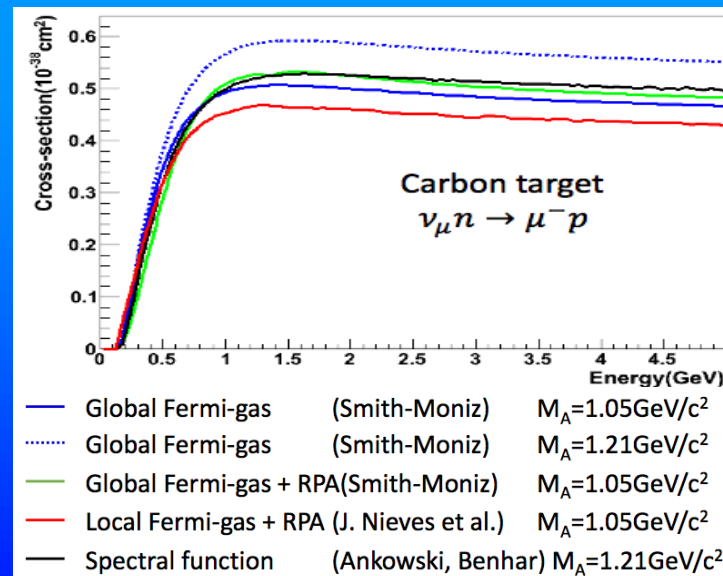

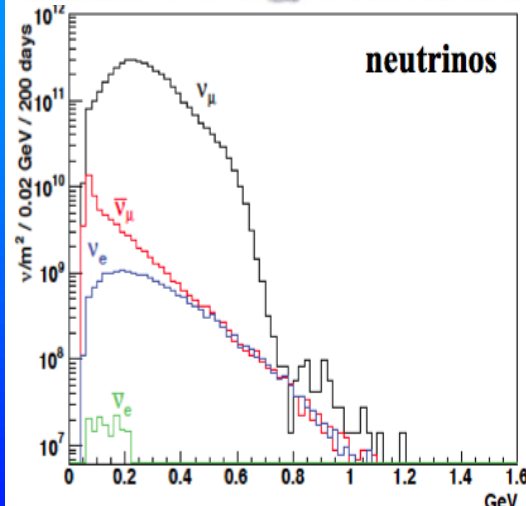

There are discrepancy between low and high energy

Neutrino energy for current experiments

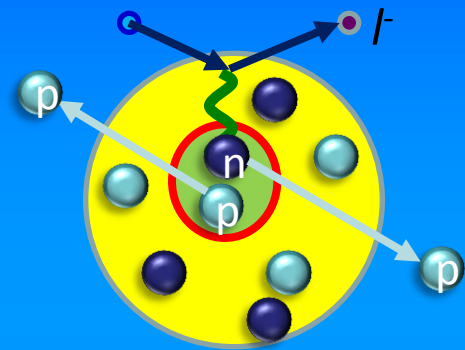

ESSvSB  $\nu$  energy distribution

In cross-section of CCQE-like events, measured value is much larger than the simple model predictions → new interaction process (2p2h) ?

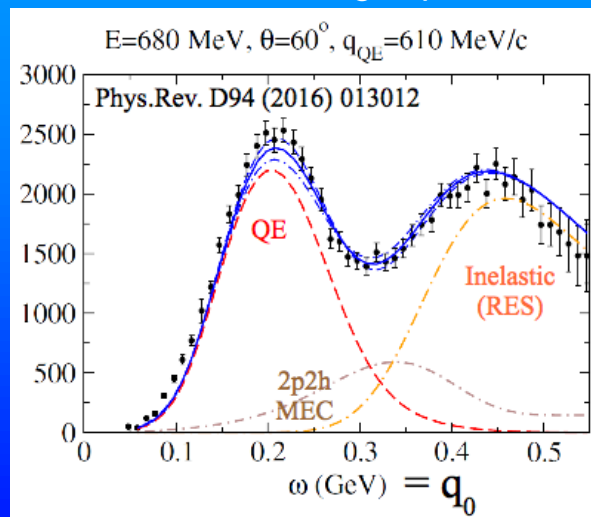

- There is experimental indication of binding nucleon pair from electron scattering experiment.  
→ Need to apply in neutrino scattering experiment.
- 2p2h is judged as CCQE with the detector which can not detect protons.

Neutrino energy reconstruction of CCQE like event at far detector is wrong if 2p2h process is exist.

→ large systematic uncertainty

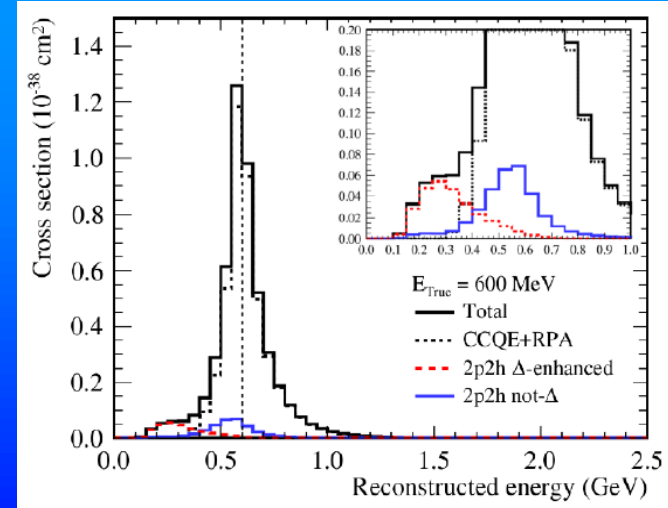

Electron scattering experiment

CCQE:  $\nu_\mu + n \rightarrow \mu^- + p$   
→ 2 body reaction

2p2h: 2protons are emitted  
 $\nu_\mu + (n, p) \rightarrow \mu^- + p + p$   
→ 3 body reaction

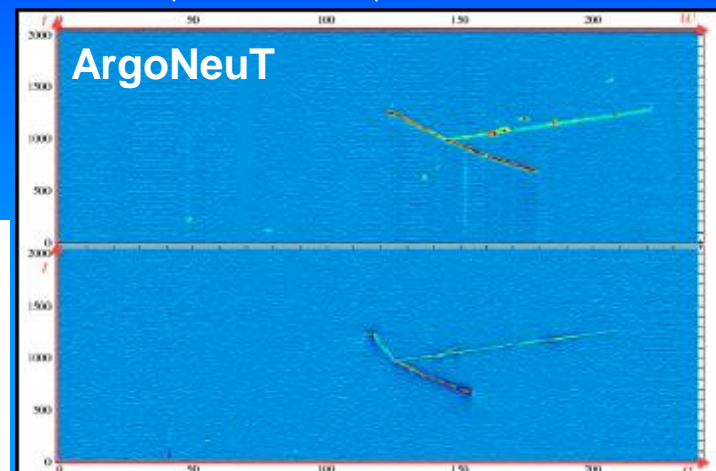

Proton measurement is important to more understand

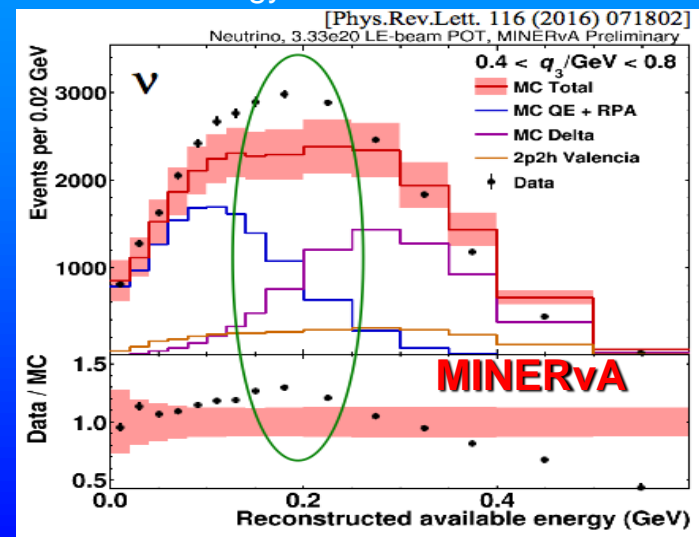

# Low energy proton measurement

- Some general models predict that back-to-back protons are emitted from binding nucleon pair in neutrino event.
- Large model dependence.

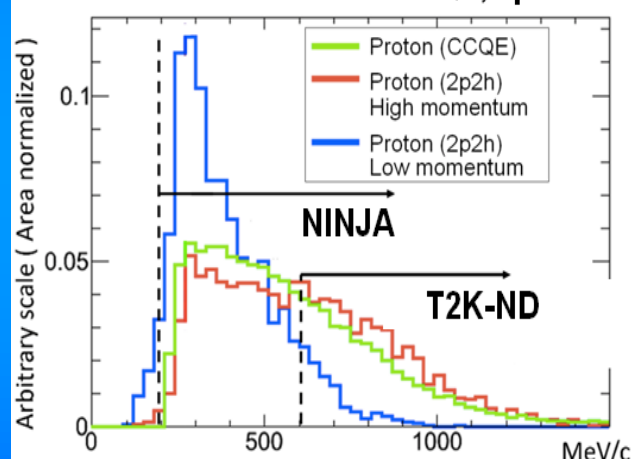

Back-to-back proton event in Liquid Argon detector (low statistics)

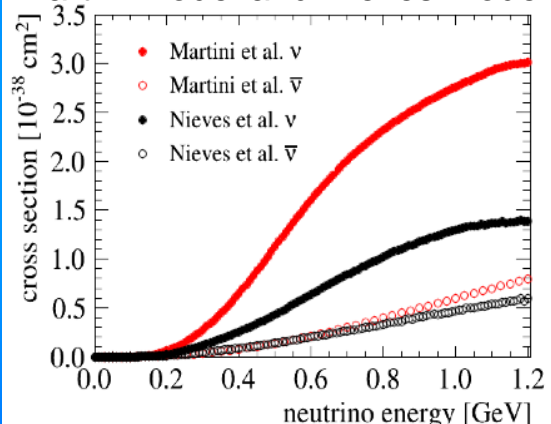

2p2h-like enhancement in reconstructed neutrino energy in  $\langle E_\nu \rangle \sim 3\text{GeV}$

Proton momentum in CCQE, 2p2h

Cross-section of 2p2h in Martini model and Nieves model

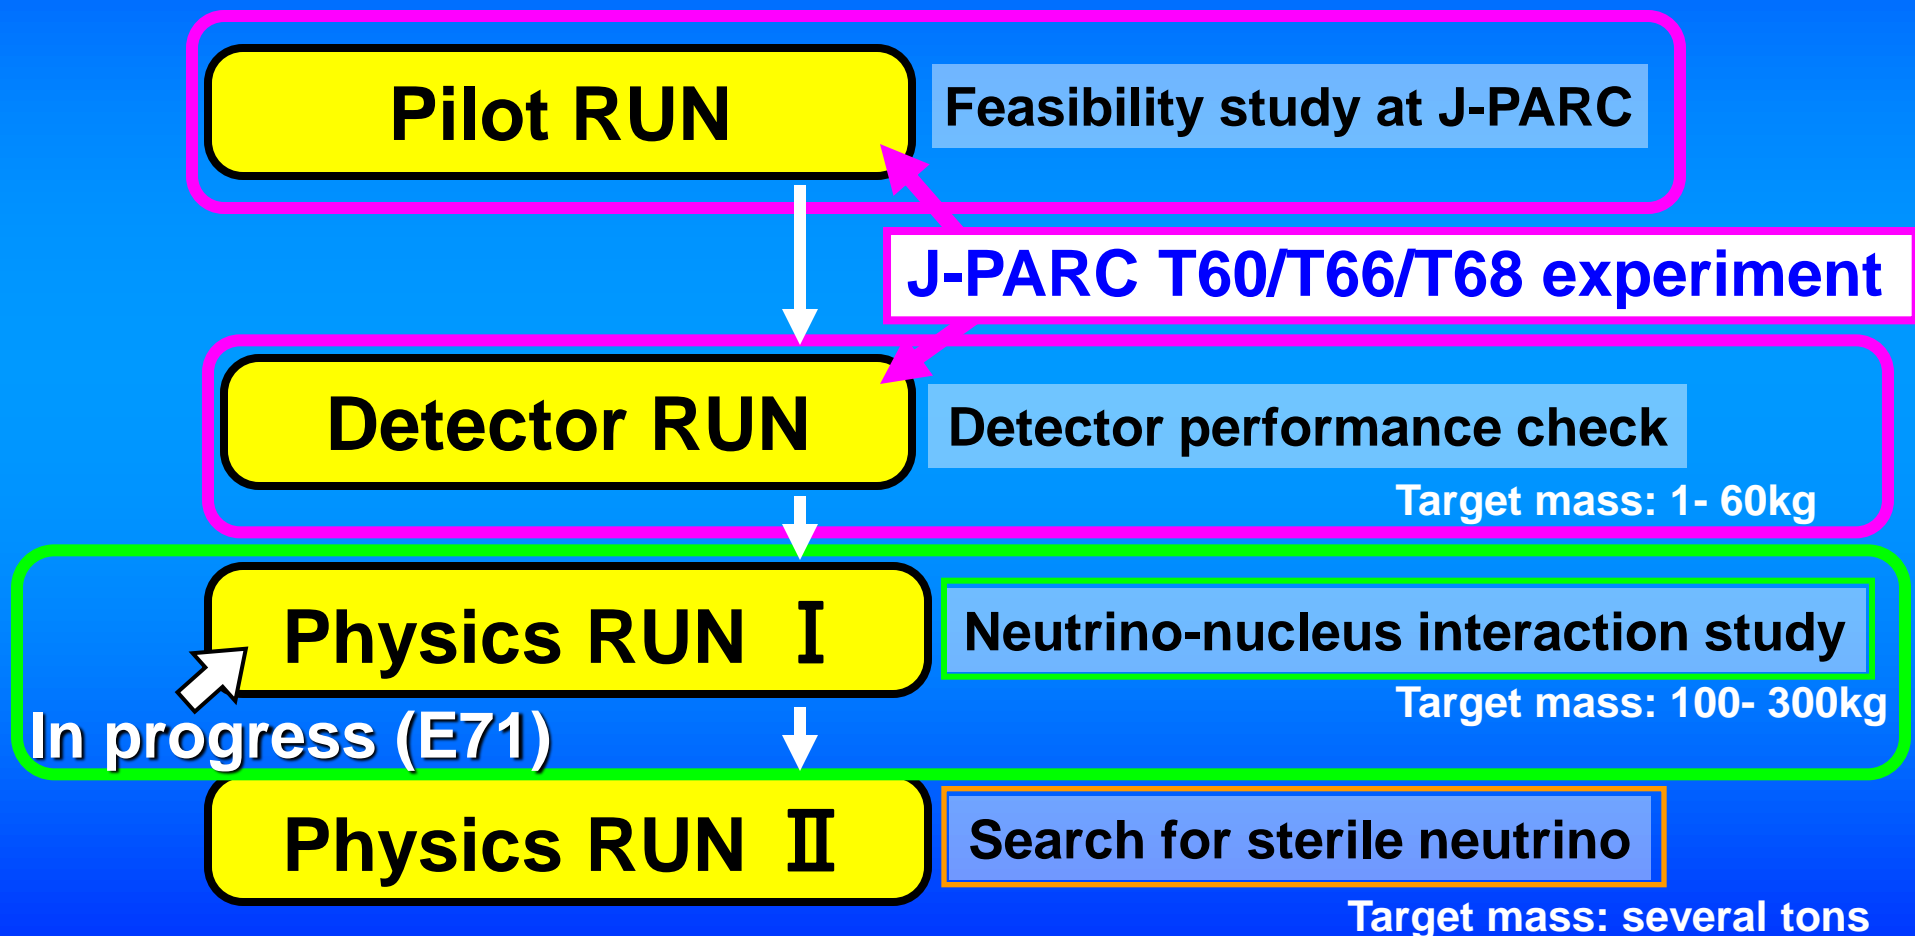

Emulsion detector can detect low energy protons for several materials, including water.  
→ New precision information

Proton information is also useful to understand not only 2p2h, but also simple CCQE.

# Roadmap

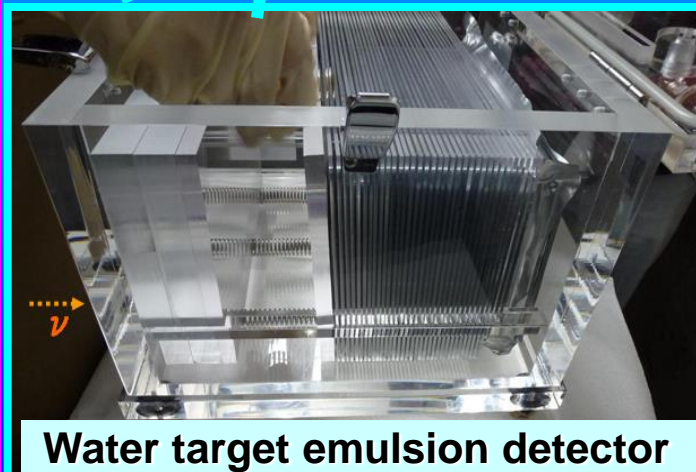

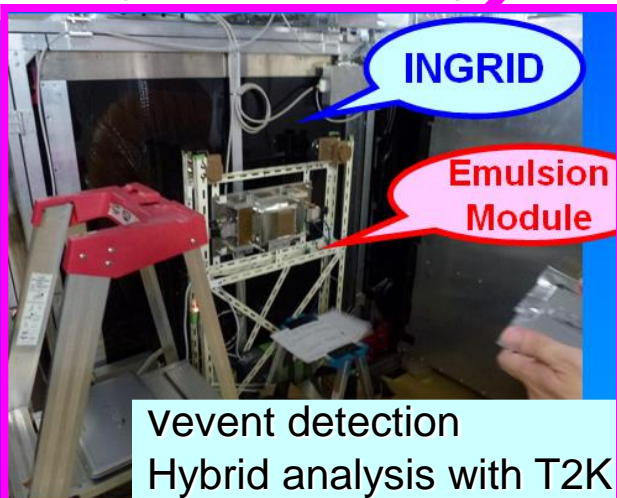

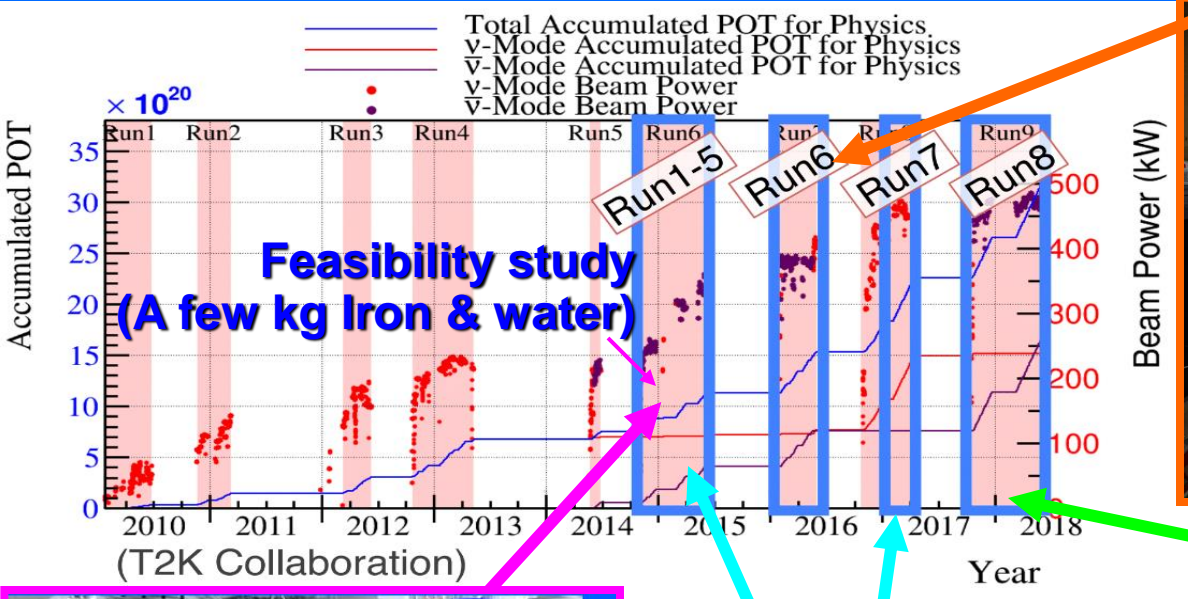

Since the end of 2014, we have demonstrated the basic performance of emulsion detector in test experiments.

**Physics run will be started from Nov. 2019.**

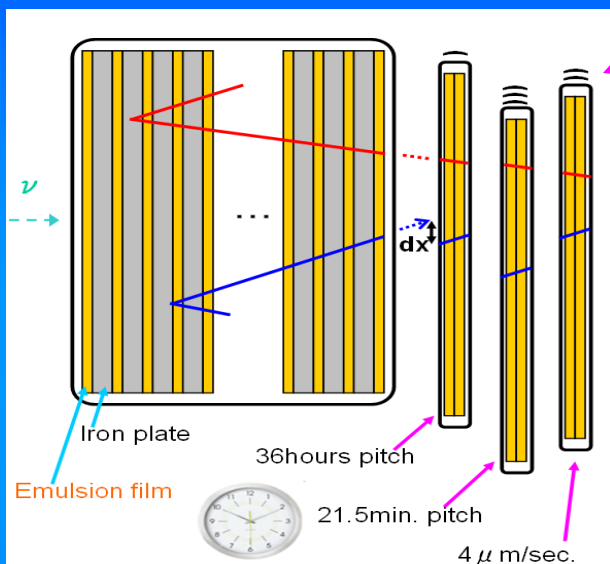

# $\nu$ exposure of NINJA

Since the end of 2014, we have demonstrated the basic performance of emulsion detector in test experiments.

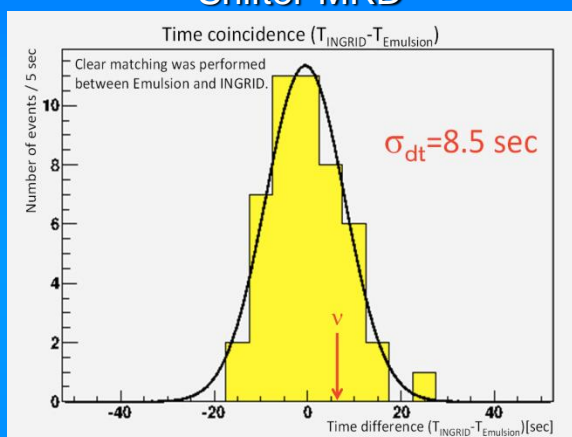

# Detector Run: Iron ECC + ES + MRD

Target: Iron~40kg, Beam:  $0.4 \times 10^{20}$  POT Neutrino mode

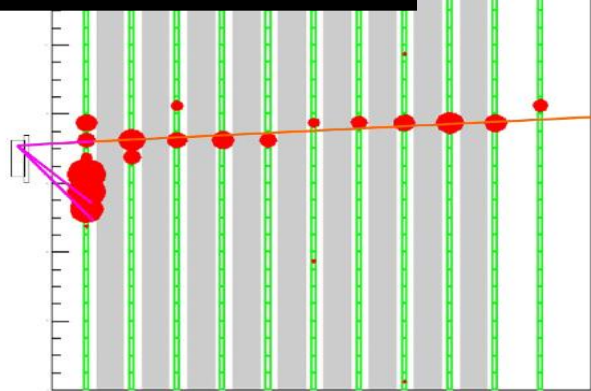

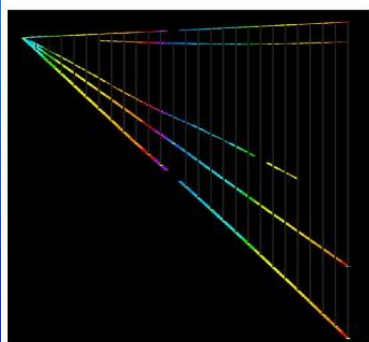

Emulsion Shifter

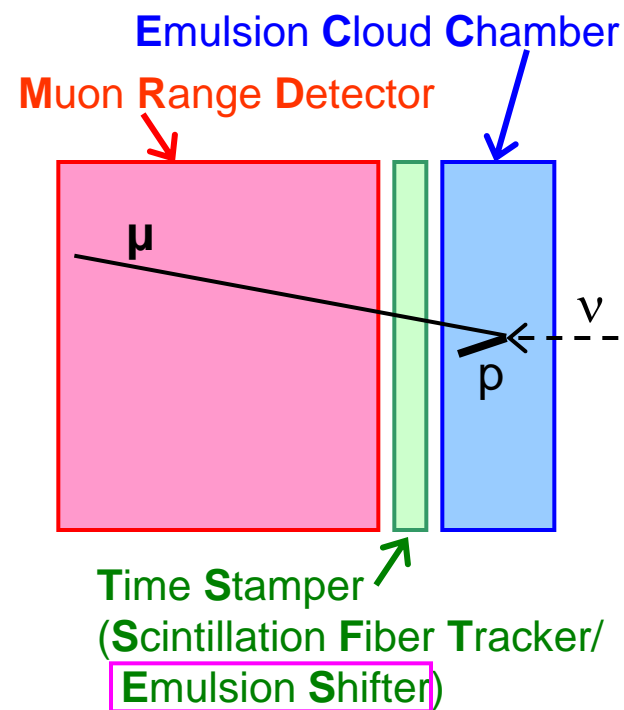

Shifter-MRD

Emulsion-MRD hybrid analysis with ES

Conceptual design

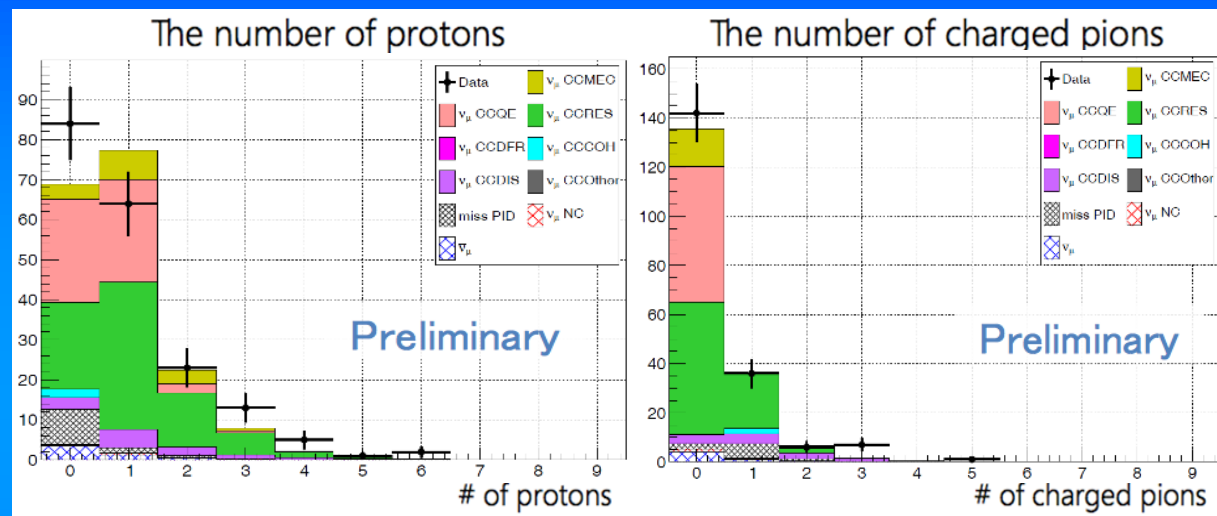

ECC → event analysis

MRD → muon identification

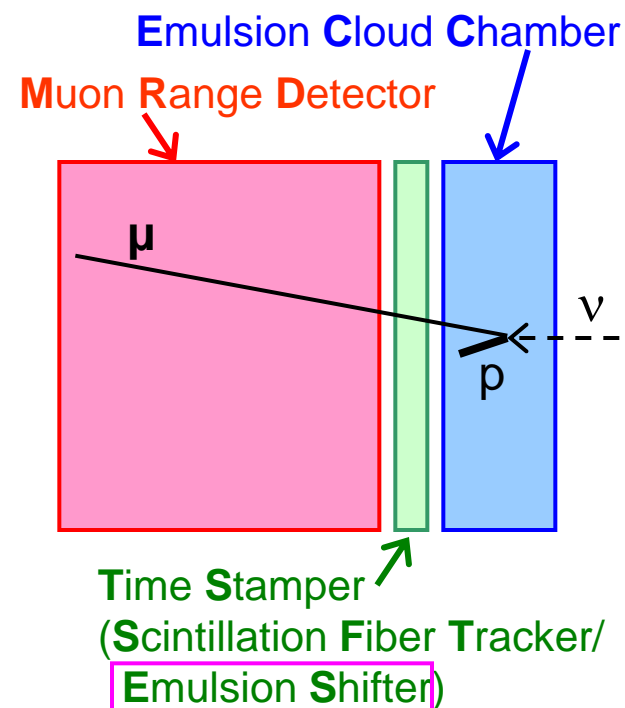

TS → event connection between  
ECC and MRD

# Detector Run: Iron ECC + ES + MRD

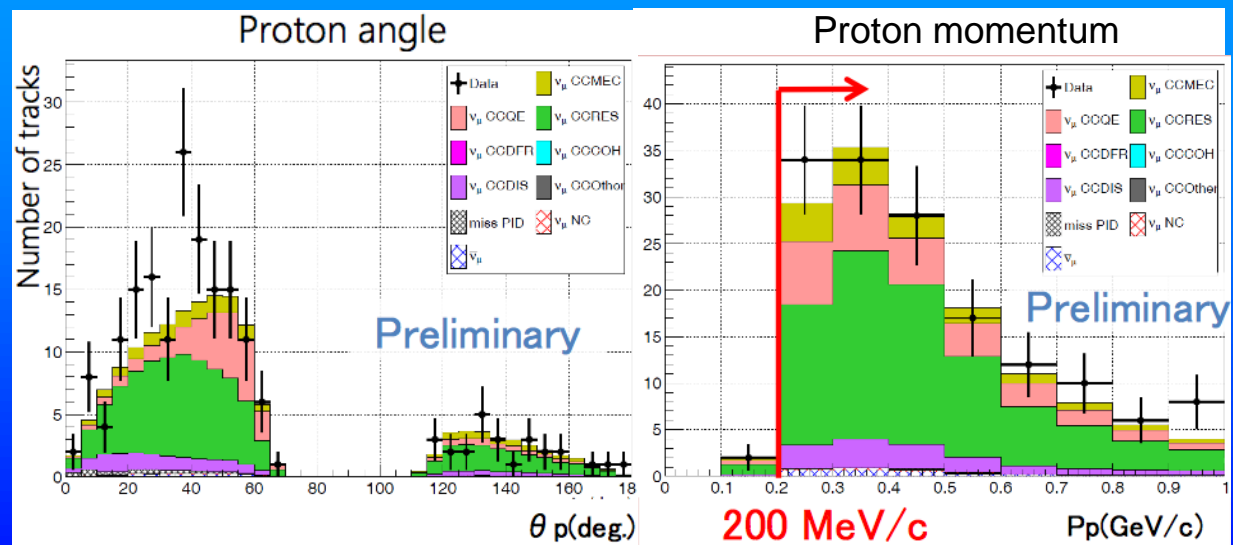

Target: Iron~40kg, Beam:  $0.4 \times 10^{20}$  POT Neutrino mode

## Conceptual design

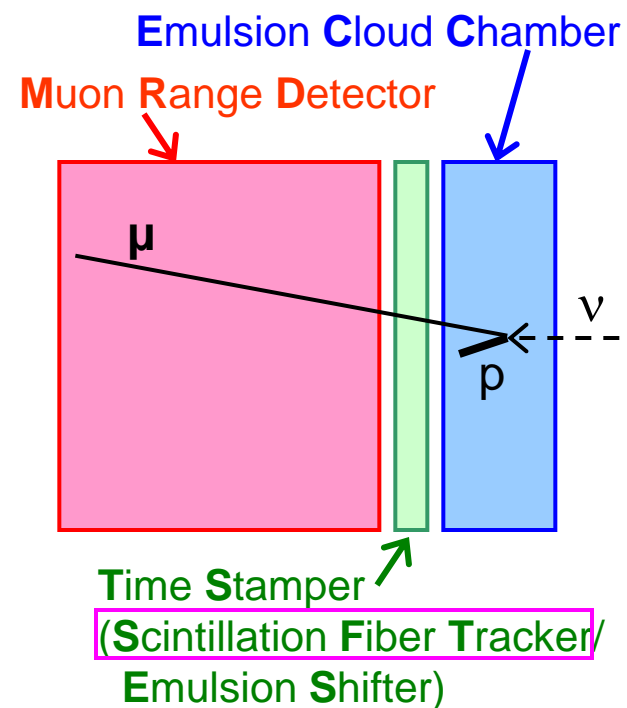

ECC → event analysis  
MRD → muon identification  
TS → event connection between  
ECC and MRD

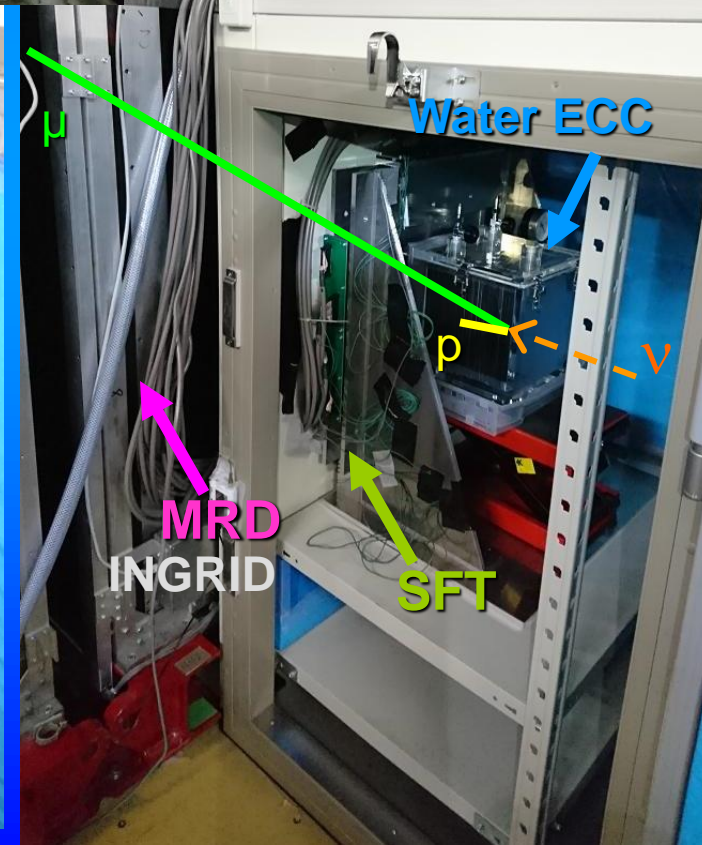

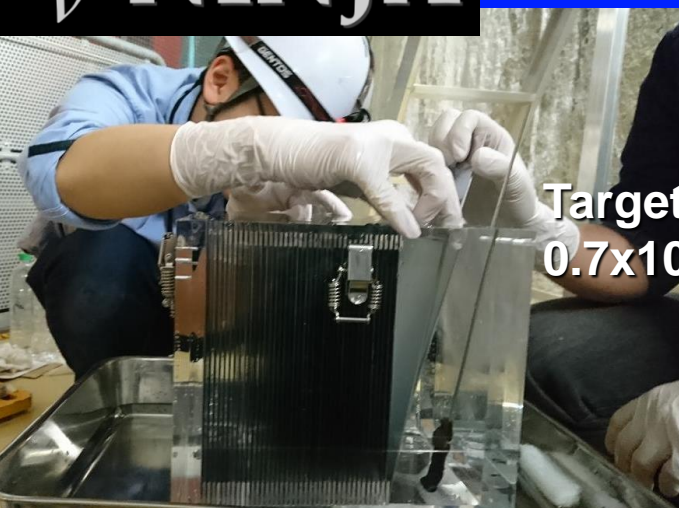

## Detector Run: Water ECC + SFT + MRD

Target: Water~4kg,  
 $0.7 \times 10^{21}$  POT, Anti-neutrino mode

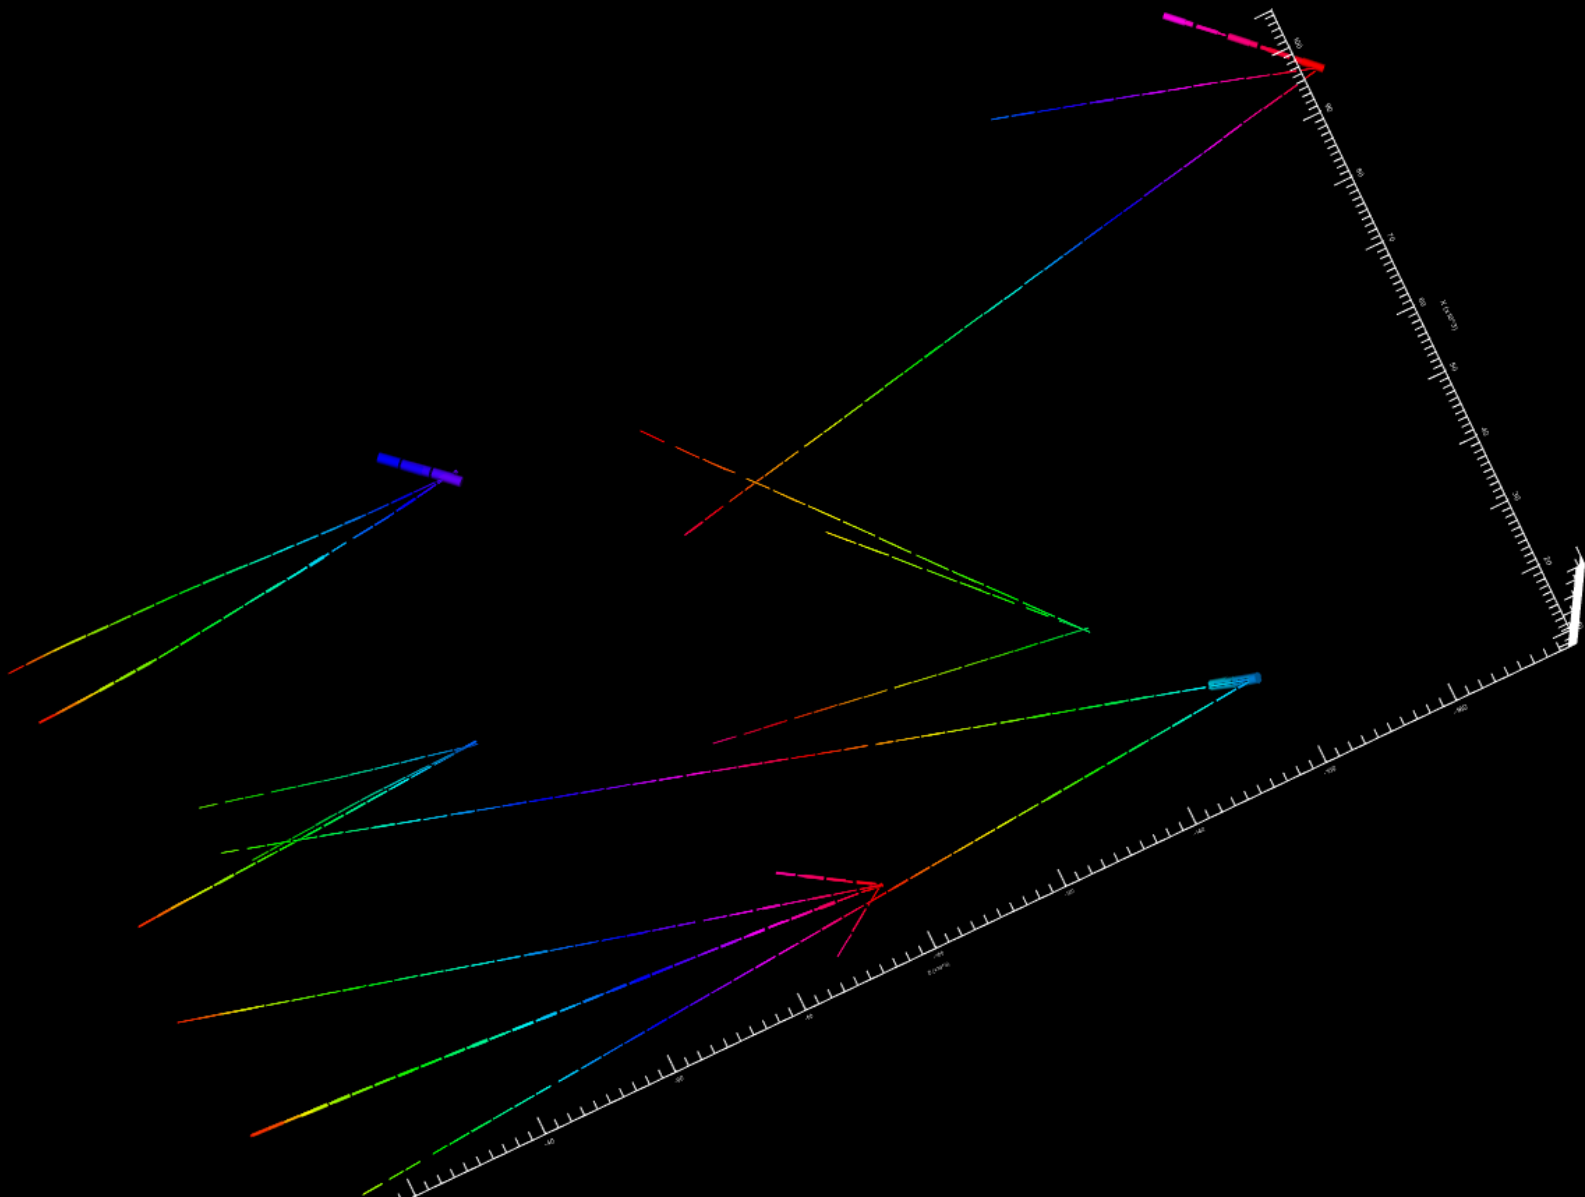

### Conceptual design

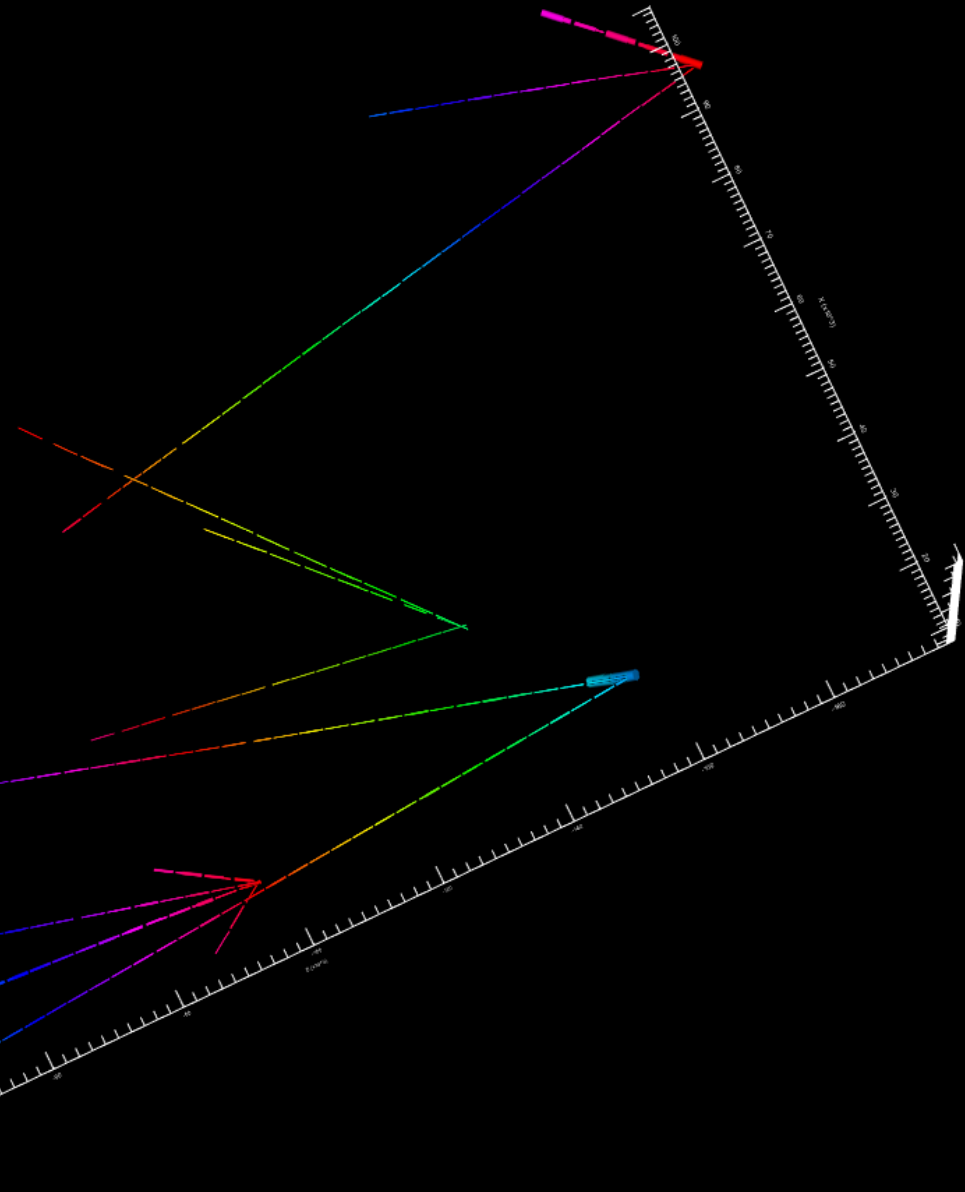

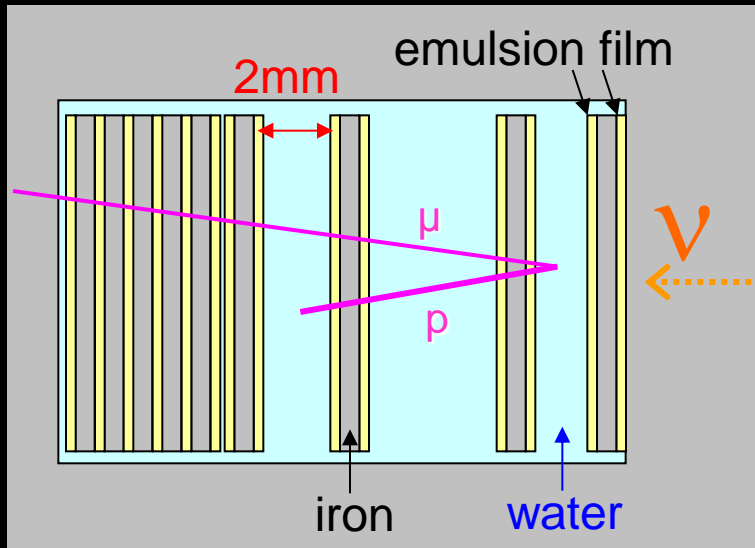

ECC → event analysis  
MRD → muon identification  
TS → event connection between  
ECC and MRD

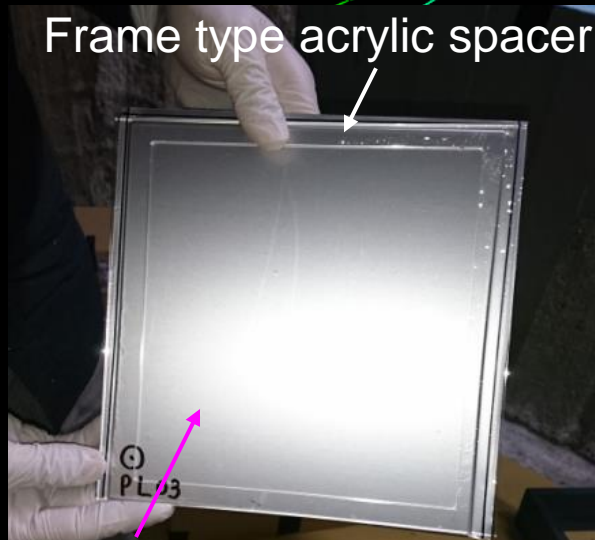

# $\bar{\nu}$ -water interactions

# $\bar{\nu}$ -water interactions

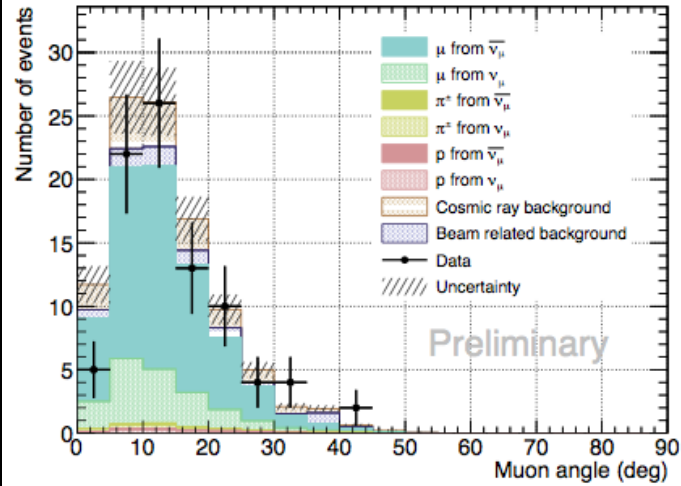

Frame type acrylic spacer

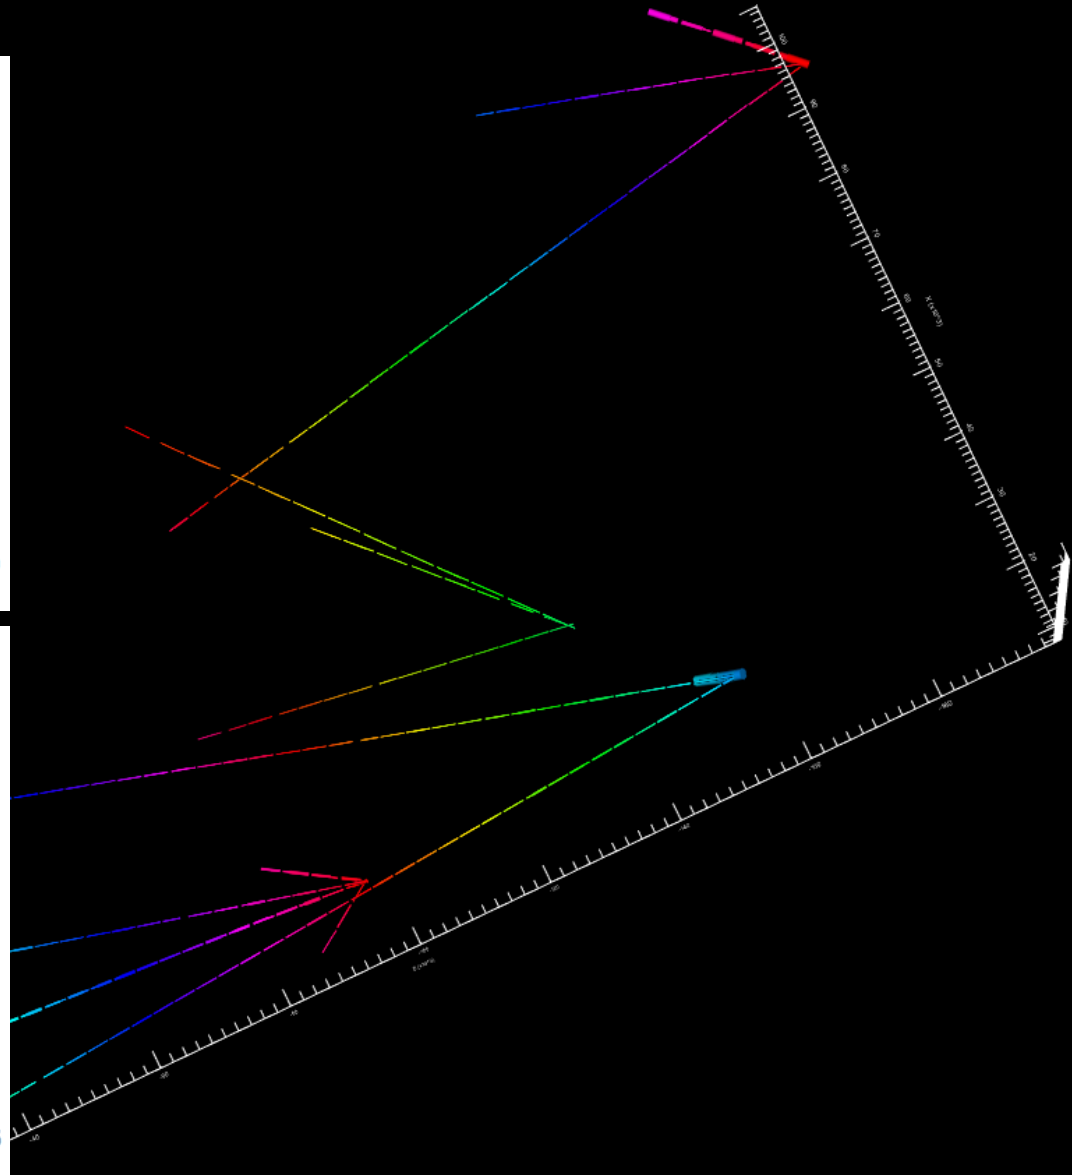

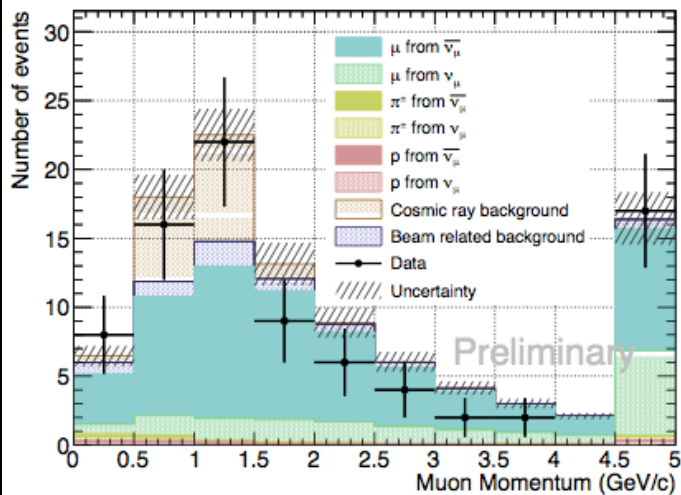

Vacuum packed emulsion films

## $\bar{\nu}$ -water interactions

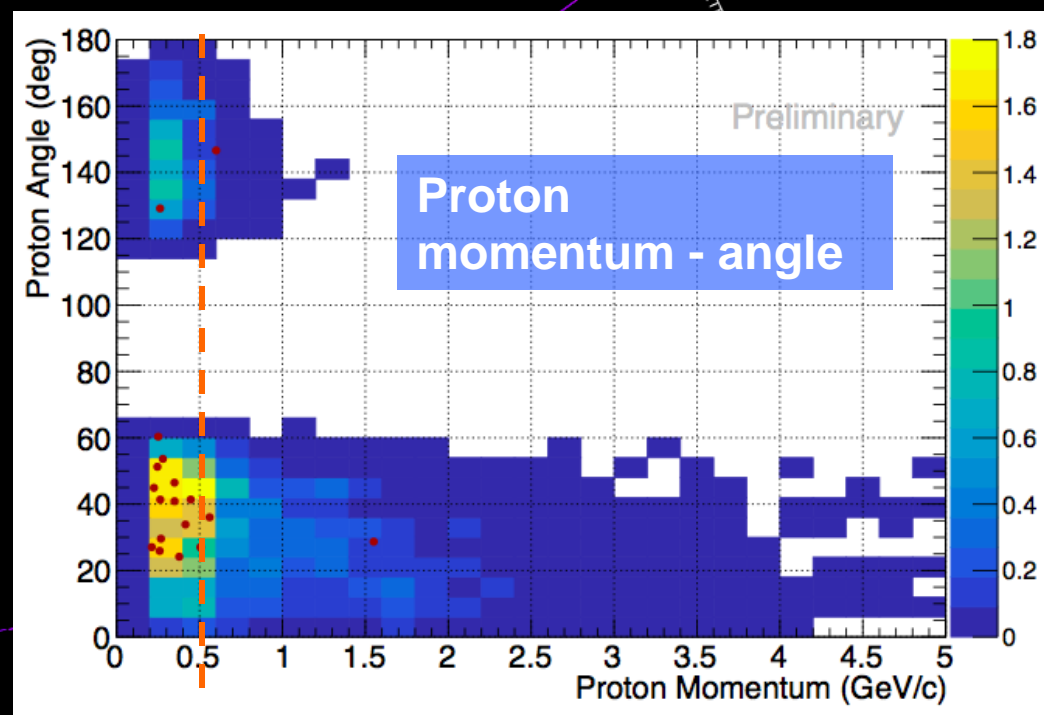

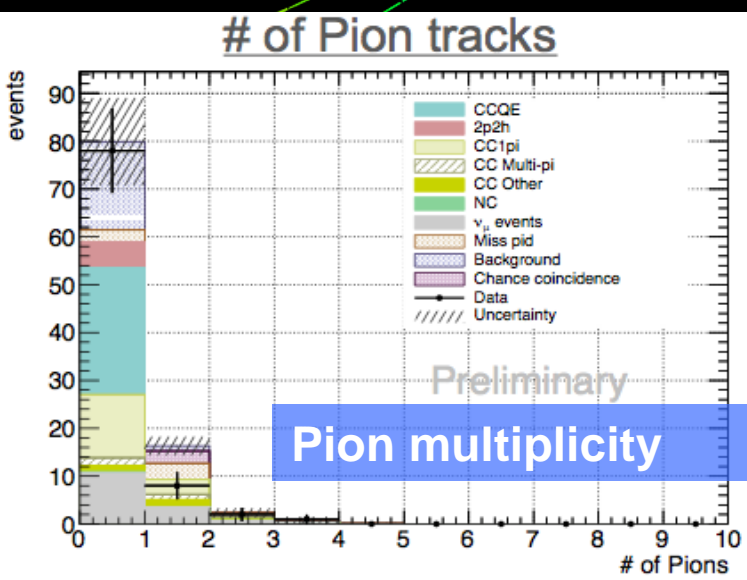

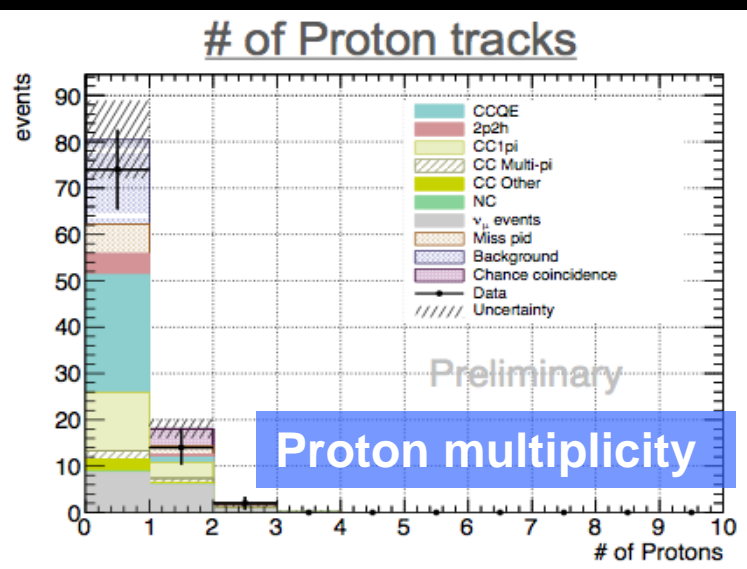

### Muon angle

### Muon momentum

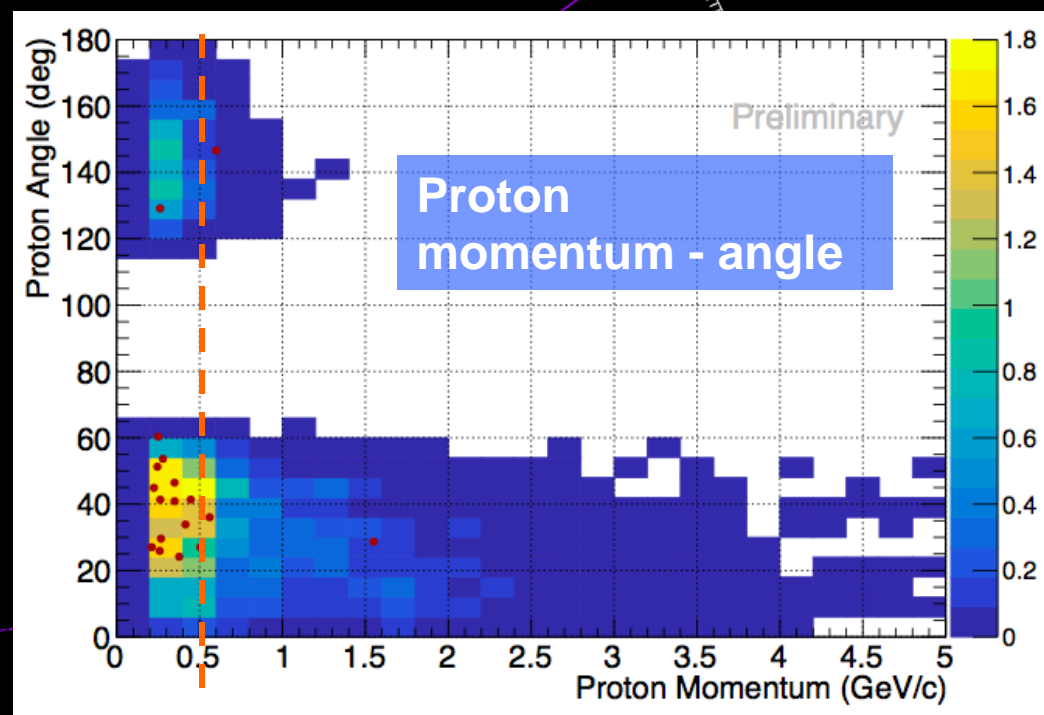

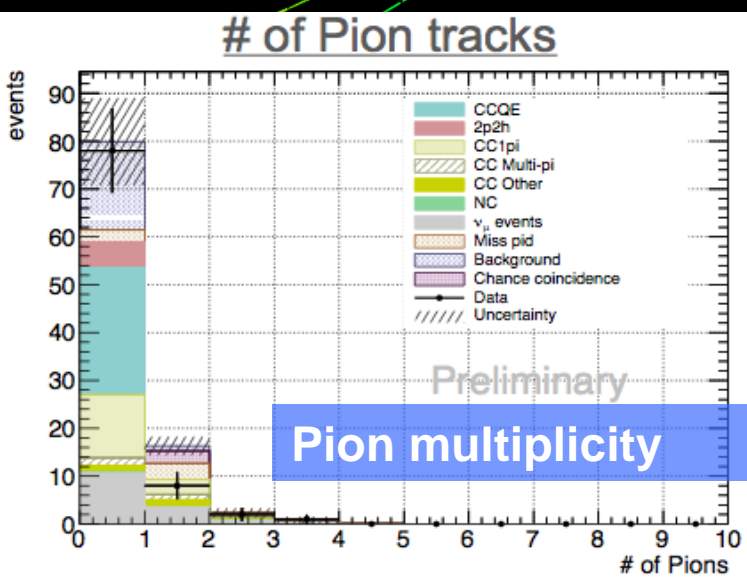

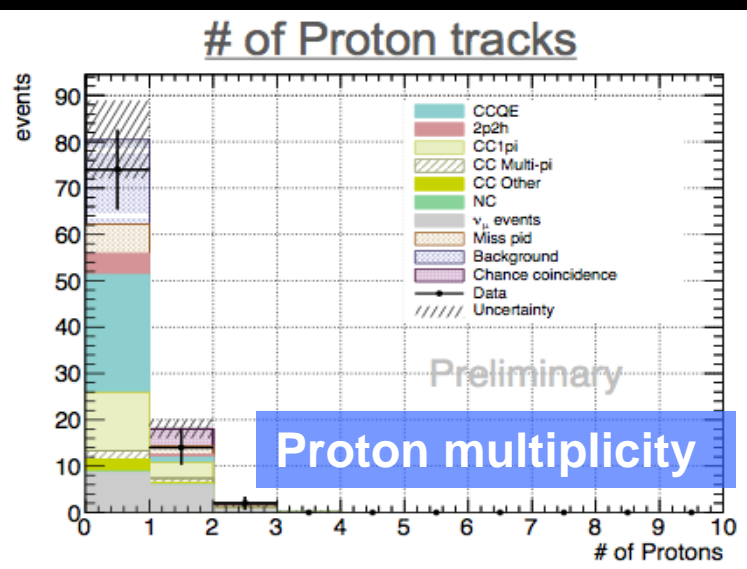

# $\bar{\nu}$ -water interactions

First measurement of low energy protons below 500MeV/c from  $\bar{\nu}$ -water interactions

# $\bar{\nu}$ -water interactions

First measurement of low energy protons below 500 MeV/c from  $\bar{\nu}$ -water interactions

More statistics !

# Physics Run (J-PARC E71)

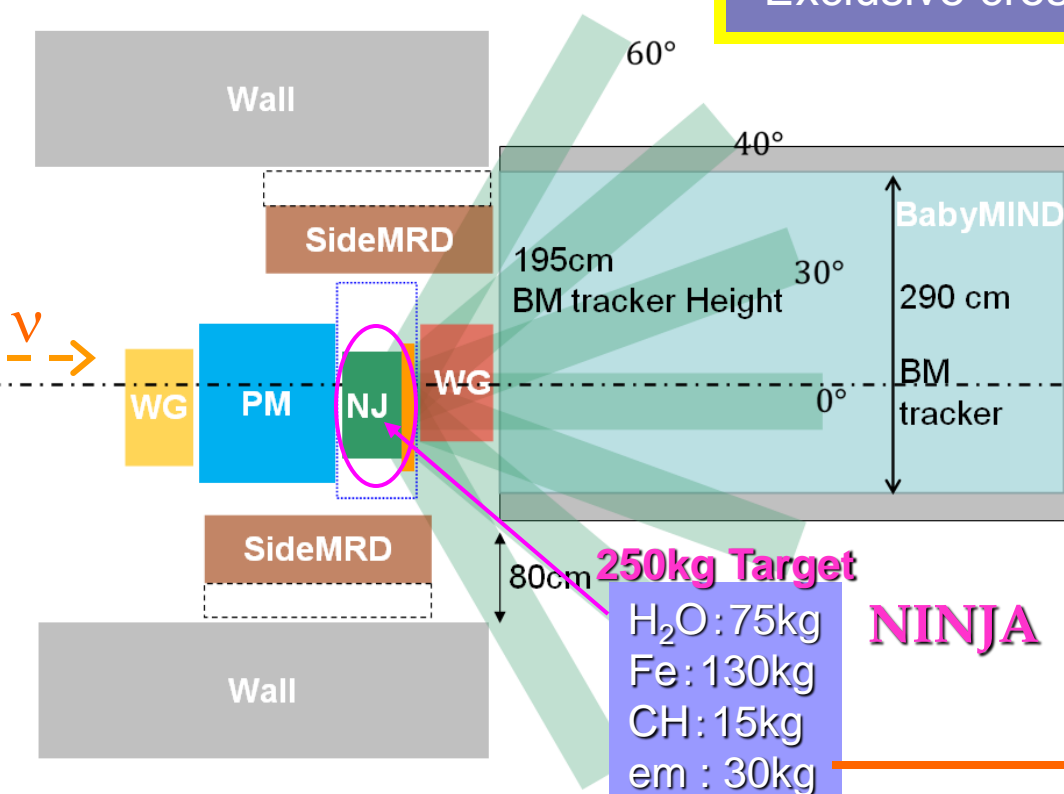

We proposed a new experiment (Physics Run) to study neutrino-nucleus interactions with large statistics.

**x30 statistics**

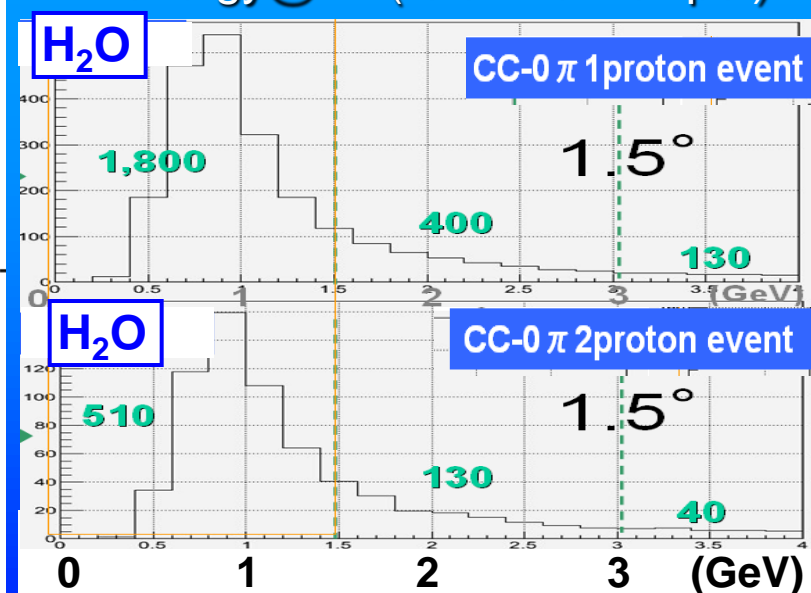

## Sub-Multi GeV Neutrino interaction

- Confirmation and cross-section measurement of 2p2h
- Exclusive cross-section measurement of  $\nu_\mu$  and  $\nu_e$

Detector setup @J-PARC B2 floor

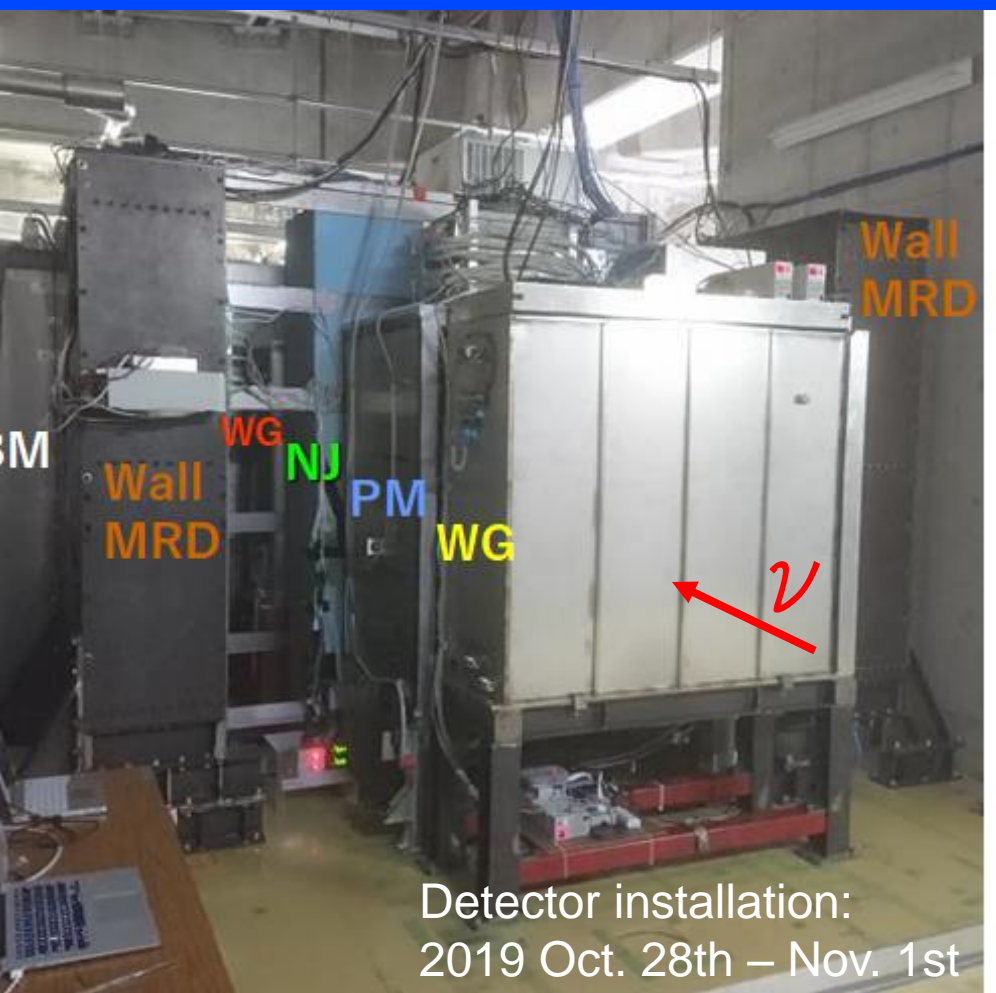

$\nu$  energy@B2 (total  $1.0 \times 10^{21}$  pot)

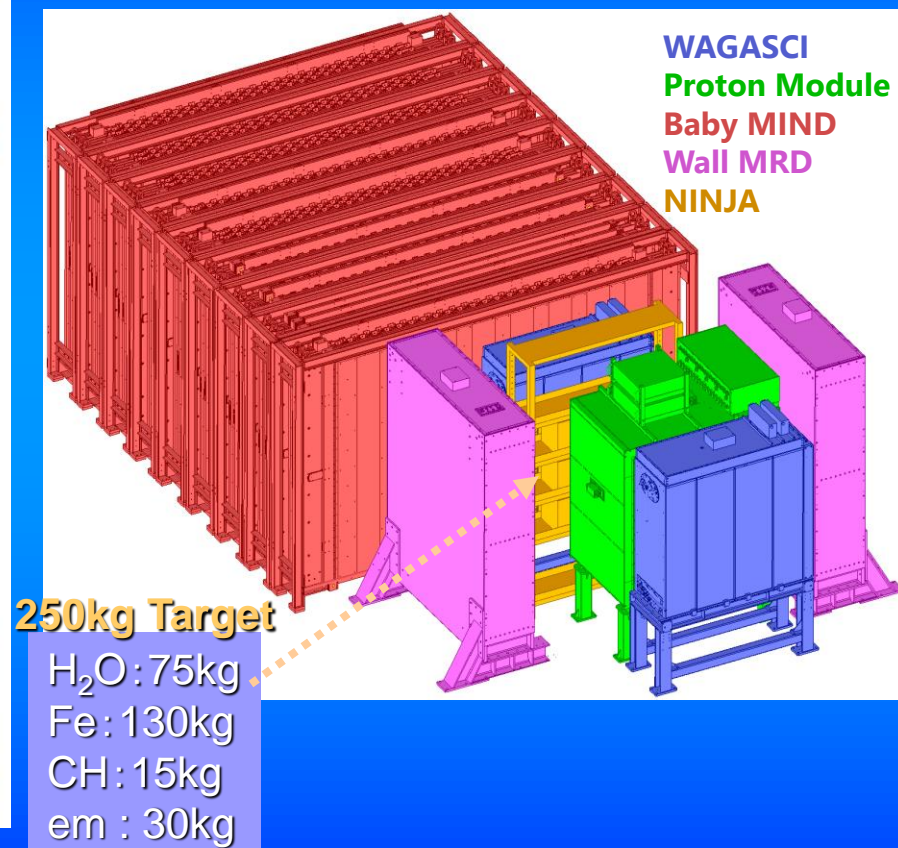

→ Total ~10k CC events

# Neutrino detector

Hybrid with T2K near detectors  
Baby MIND is used for muon ID

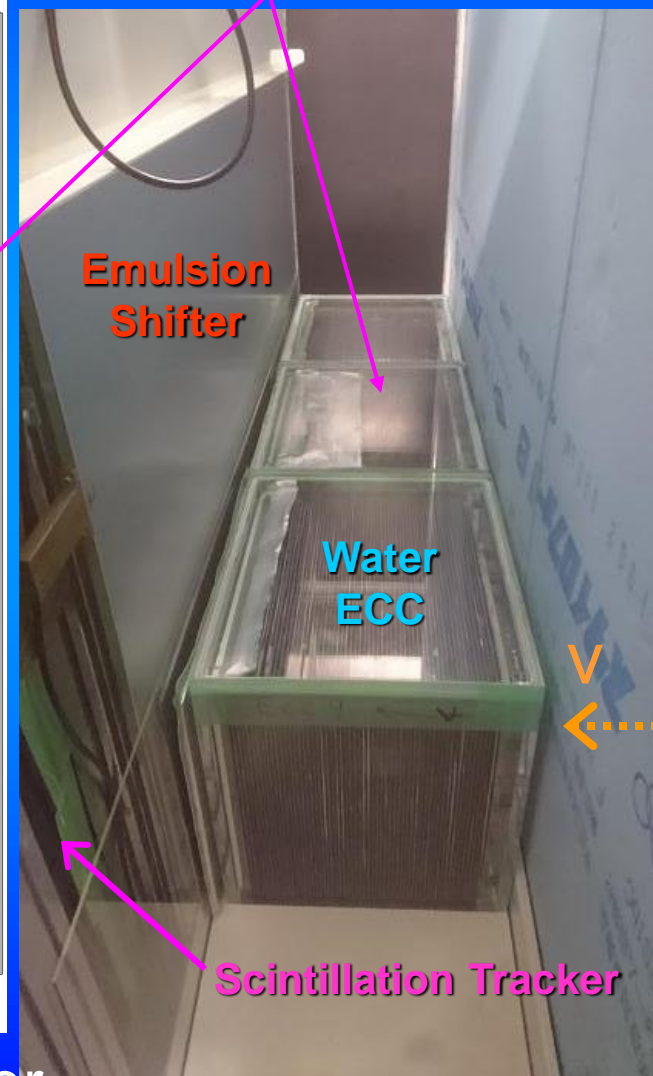

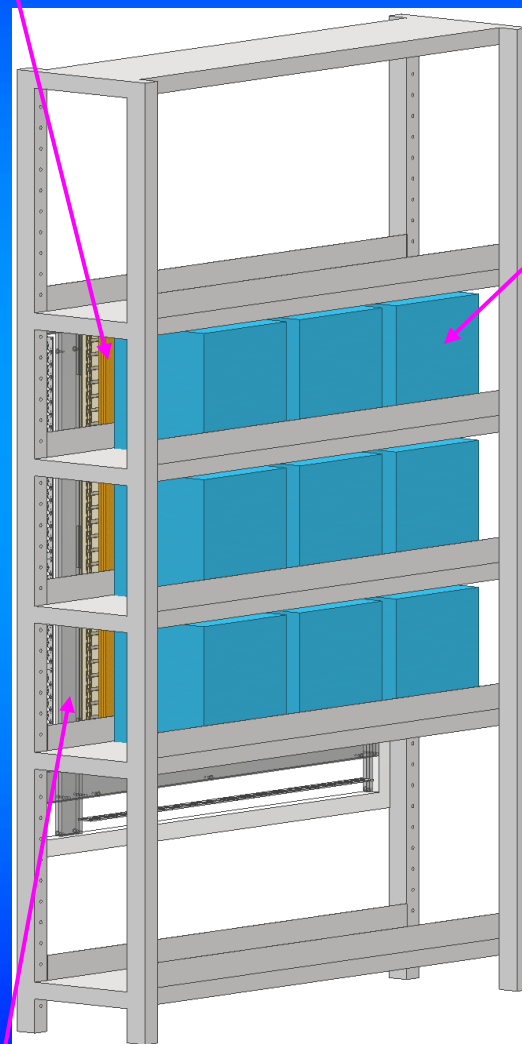

Neutrino beam: 2019/11/7→12/19, 2020/1/14→2/12  
Total POT:  $4.8 \times 10^{20}$

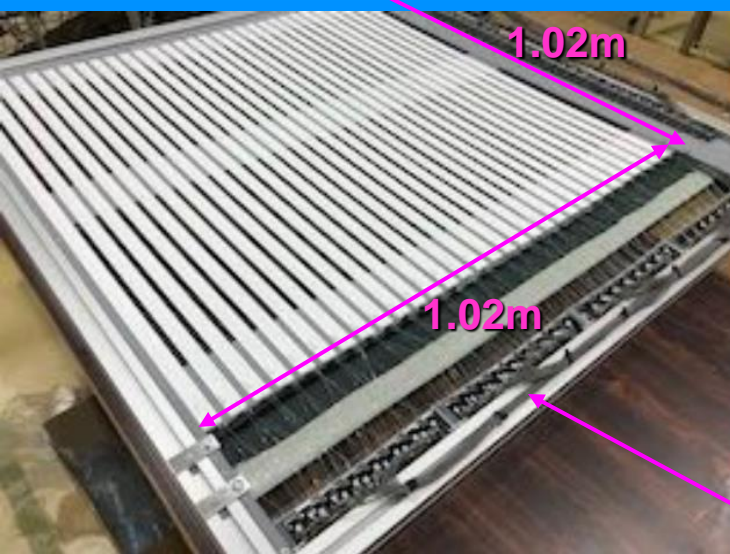

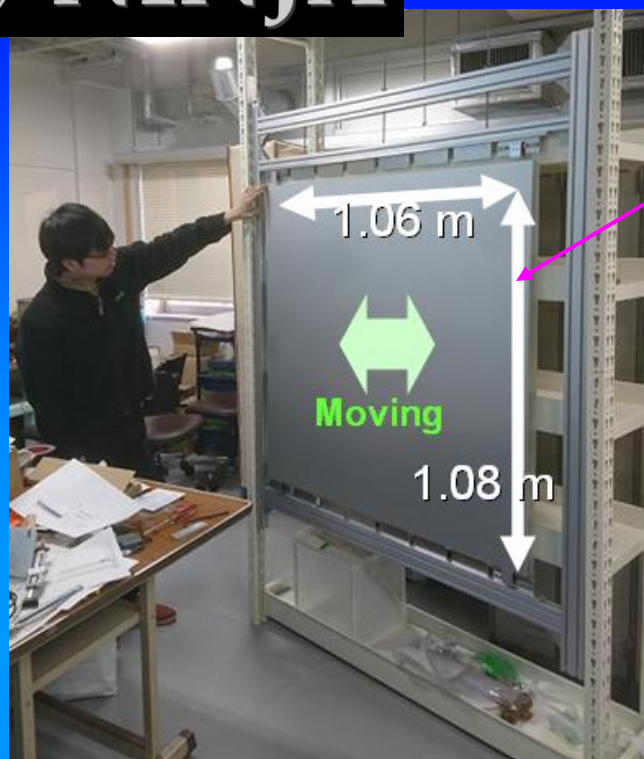

## NINJA detector

Emulsion Shifter

Water ECC

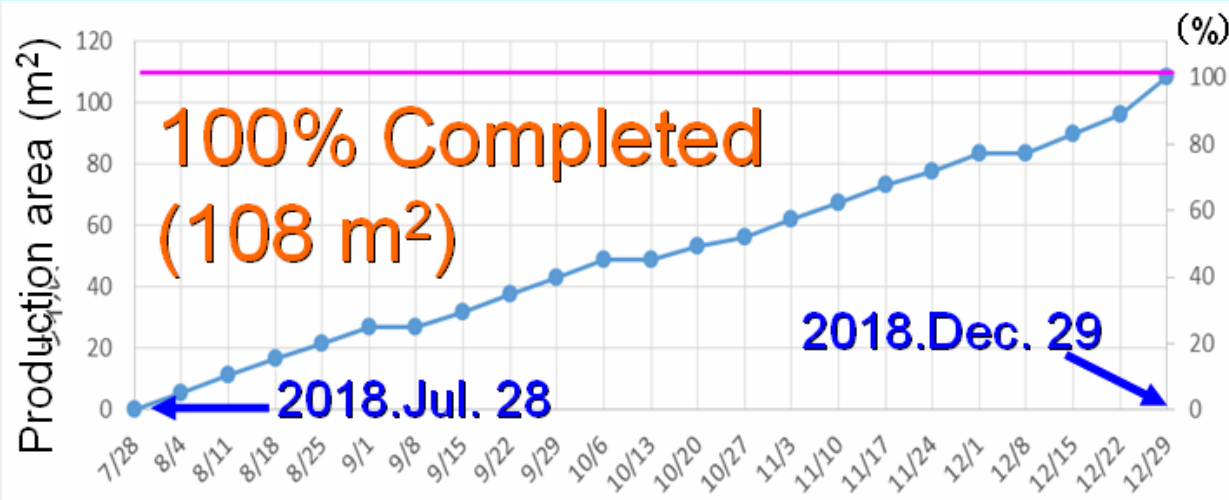

Scintillation Tracker

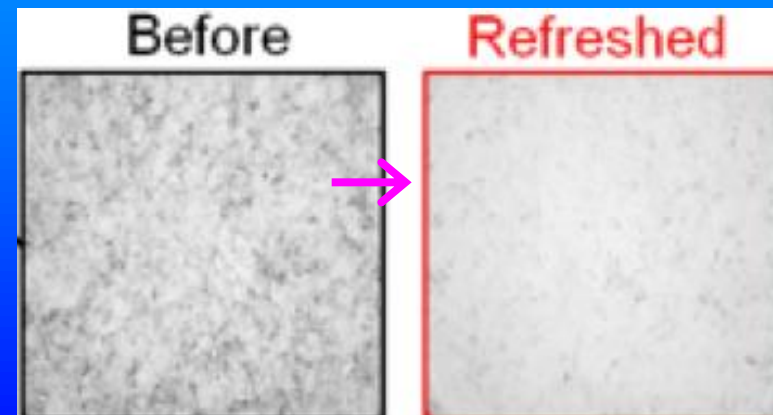

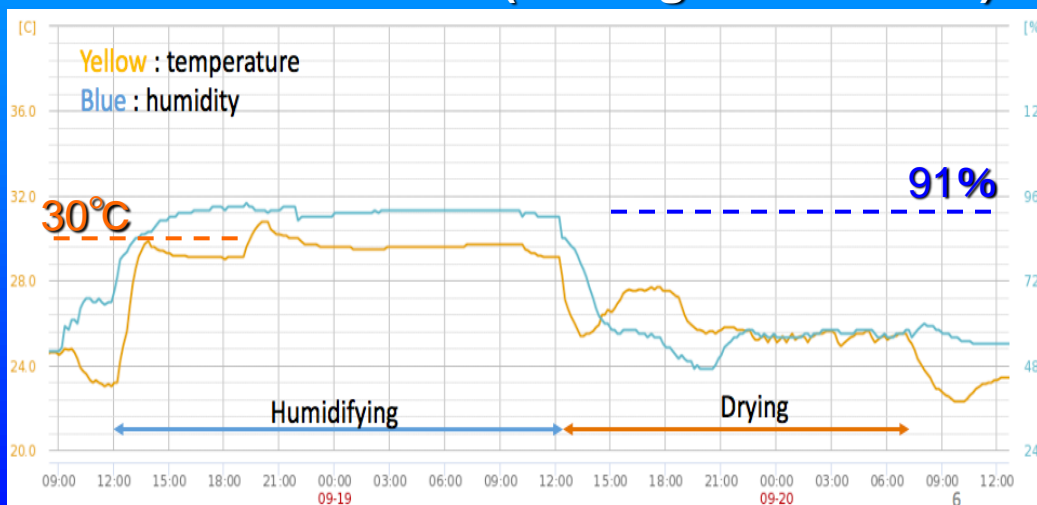

# Emulsion film preparation

## Emulsion film production

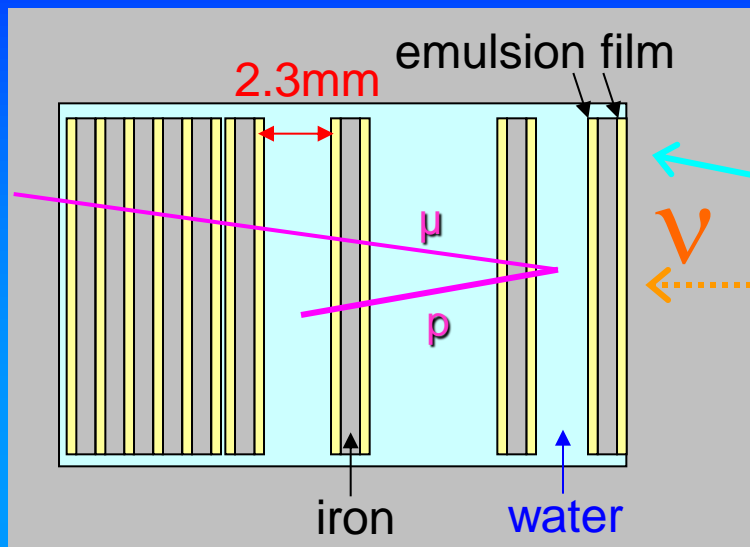

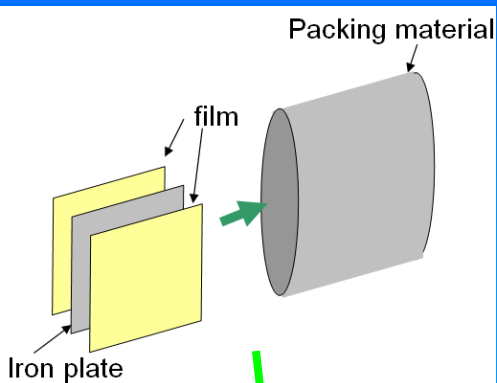

25cm x 25cm films: ~1300 films  
 34cm x 102cm films : ~ 25 films  
 ~42grains/100μm → 99% tracking eff.

## Emulsion film refresh (erasing noise tracks)

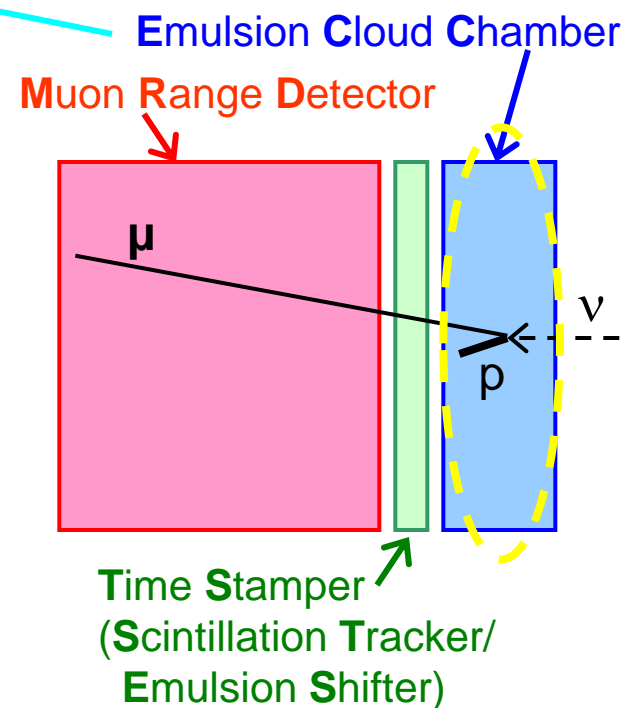

# Water ECC

Vacuum packing  
in dark room

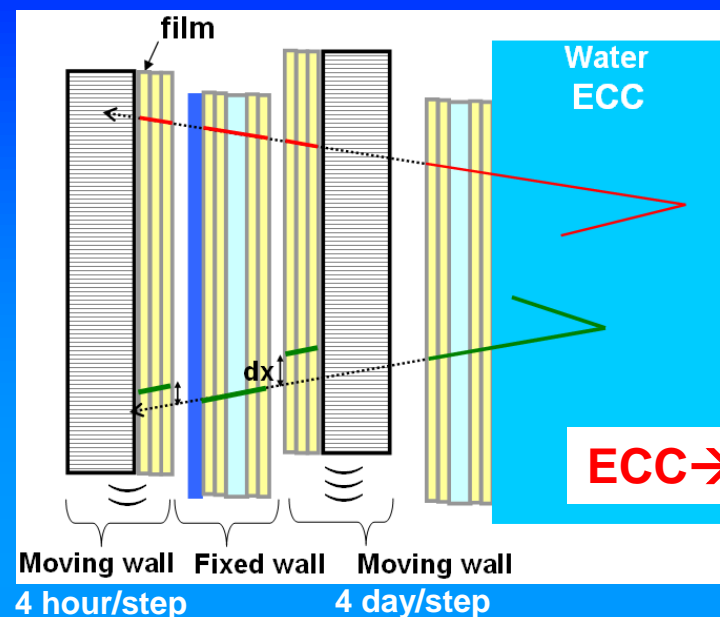

Conceptual design

Water ECC

ECC → event analysis  
MRD → muon identification  
TS → event connection between  
ECC and MRD

# Emulsion Shifter

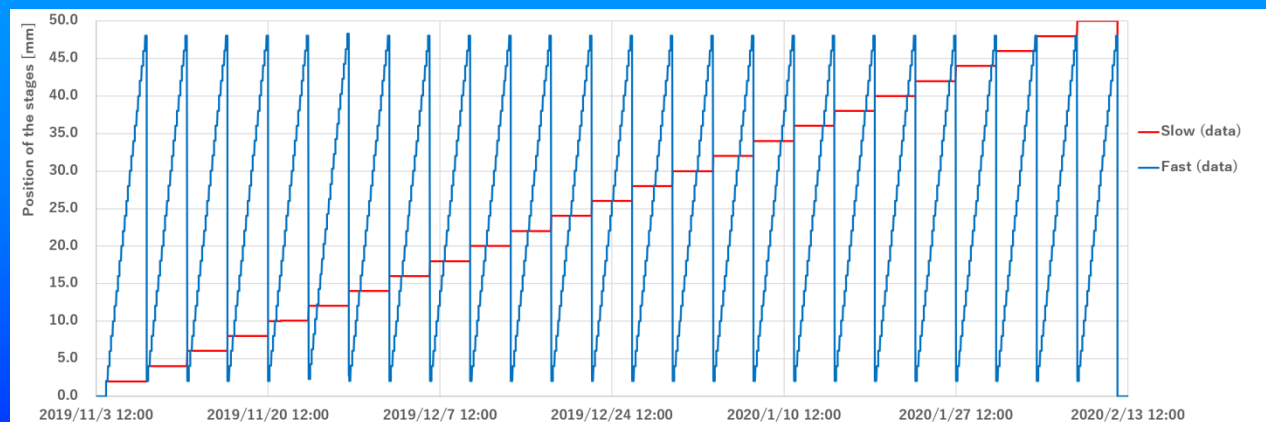

Emulsion films are set on moving walls controlled by stepping motor.

Time stamp is given by coincidence of each stages.

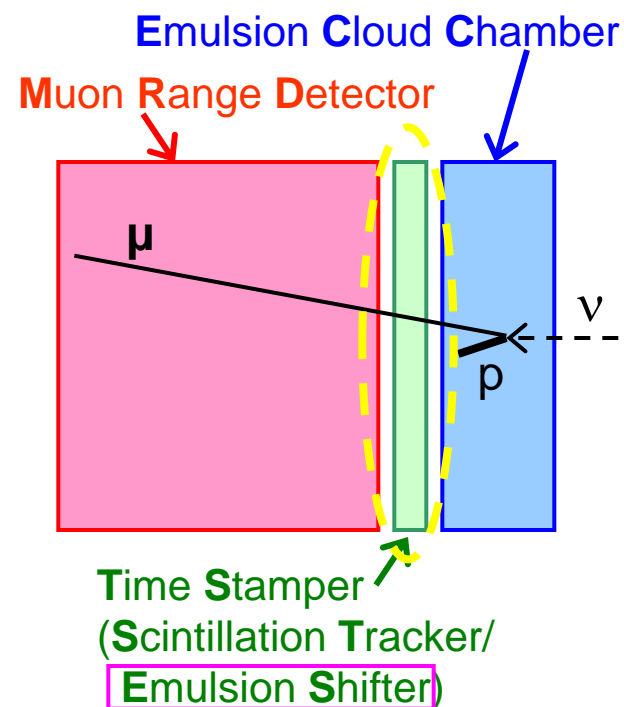

Slow wall: 4days/step  
Fast wall : 4hours/step

**ECC→ES: 4hour time stamp**

Operation of emulsion shifter was well during exposure

## Conceptual design

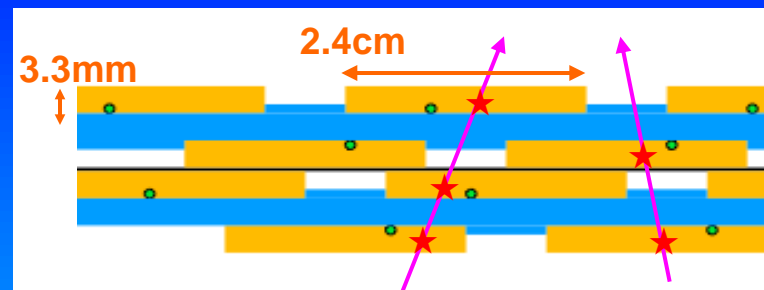

ECC→ event analysis

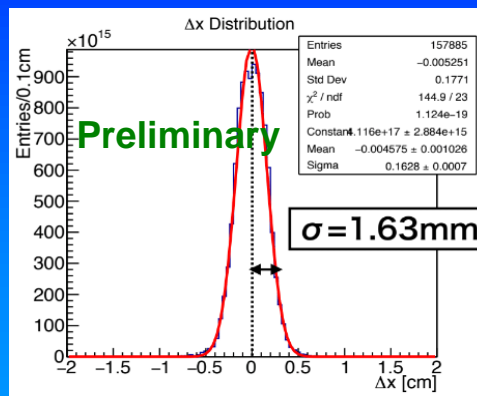

MRD→ muon identification

TS → event connection between  
ECC and MRD

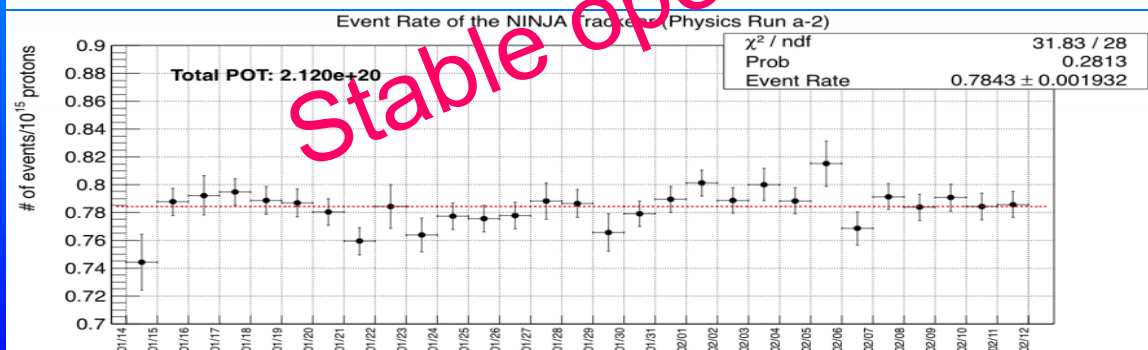

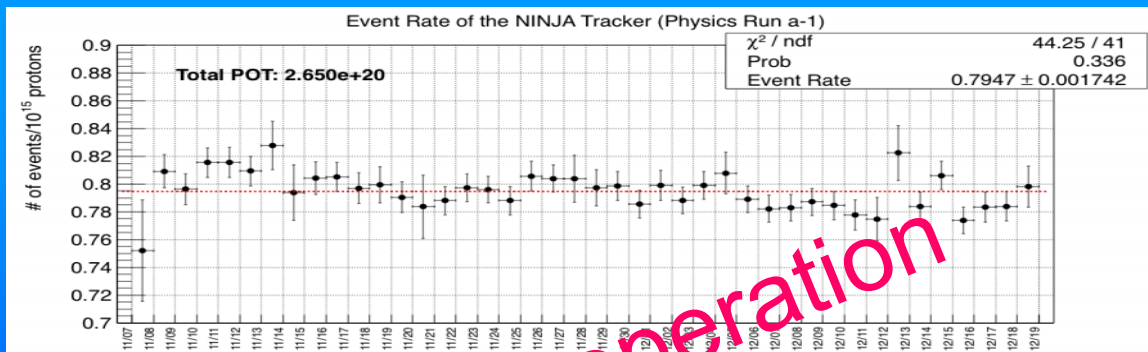

# Scintillation Tracker

Position resolution is improved by using hit/unhit combination.  
→ ~1.7mm position resolution

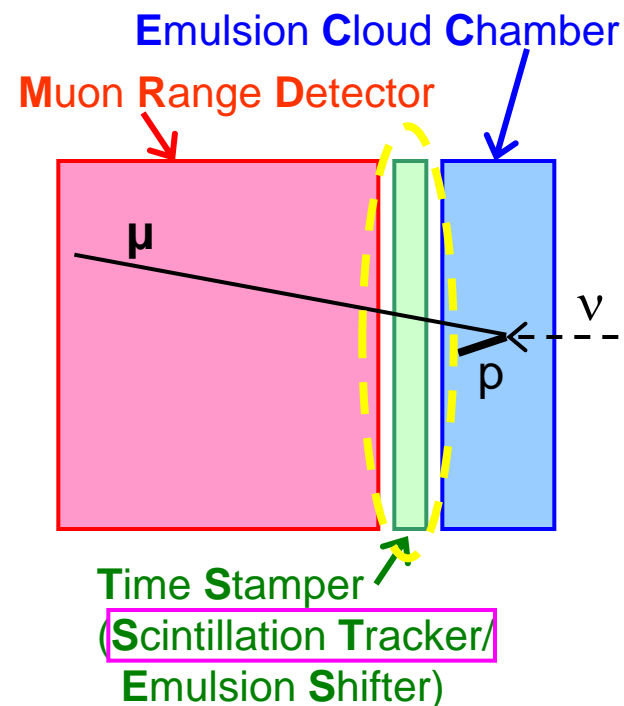

**ES→ST: 10 nsec level time stamp**

**Stable operation**

## Conceptual design

ECC→ event analysis  
MRD→ muon identification  
TS → event connection between  
ECC and MRD

## Baby MIND

### Baby MIND

MRD for T2K-WAGASCI project  
 - 33 Magnet Modules (1.5T)  
 - 18 Detector Modules

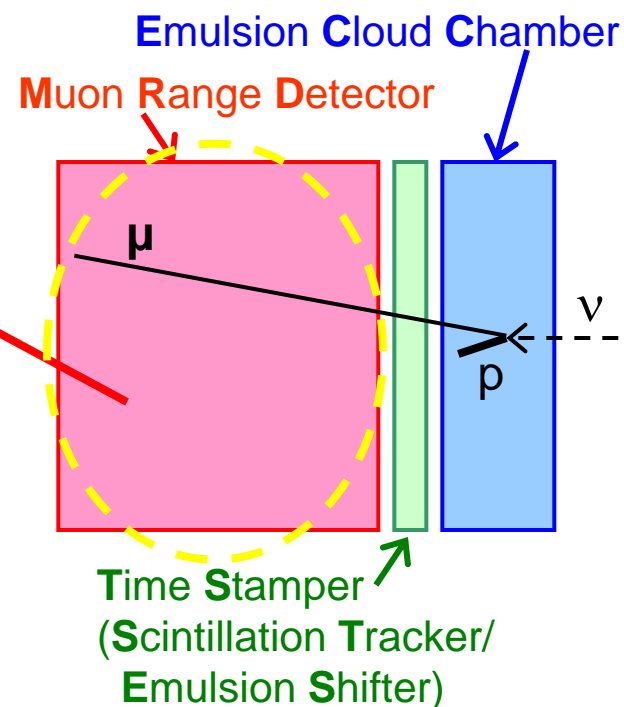

Detection efficiency >97%  
 Charge identification eff > 90%  
 Momentum resolution ~10%

→ NINJA-WAGASCI hybrid plan

We (NINJA) can use Baby MIND for MRD.

$\mu^+/\mu^-$  separation →  $\bar{\nu}_\mu/\nu_\mu$  separation

### Conceptual design

NINJA Tracker

Baby-MIND

**Blue color** hit in BM is same bunch of NINJA Tracker hit.  
(Color in NJ is only red)  
(Color in PM, BM is shown as each bunch in a spill.)

**Emulsion analysis will be started soon.**

# Expected outcomes

## Analysis:

**Momentum measurement :**

Range, Multiple Coulomb Scattering in ECC

Range in Baby MIND (only for  $\mu$ )

**dE/dx measurement :**

Blackness of tracks in ECC

$\mu$ ID : Baby MIND

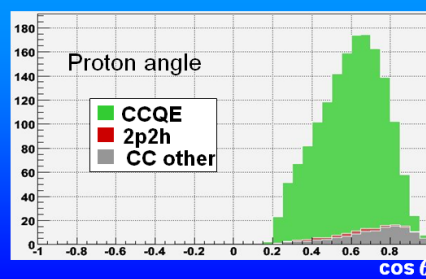

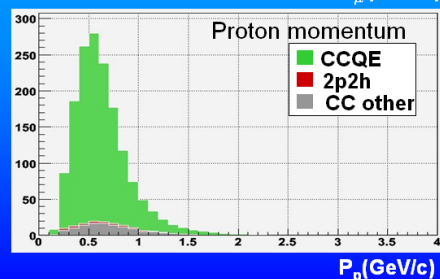

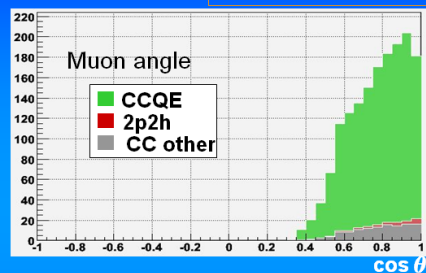

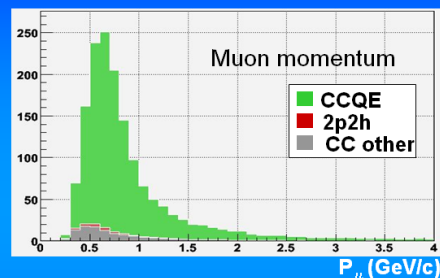

→ (Double) differential cross section measurement

## CC $0\pi 1p$ event (CCQE enriched events)

Number of events  
(68kg water target,  $1.0 \times 10^{21}$  pot)

Already applied  $\mu$  angle  
and proton detection threshold

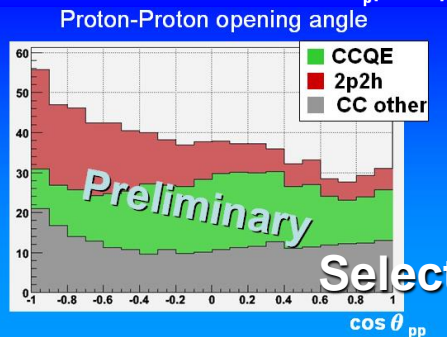

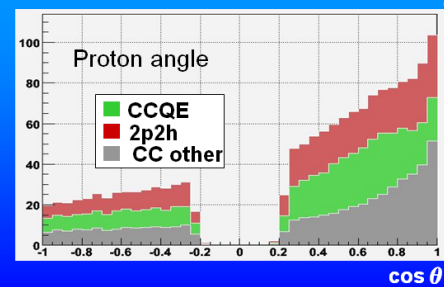

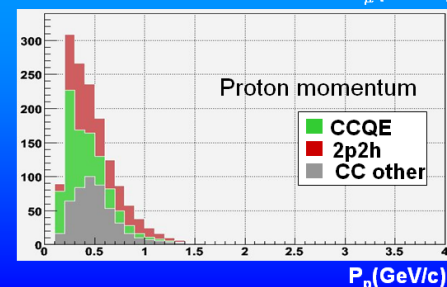

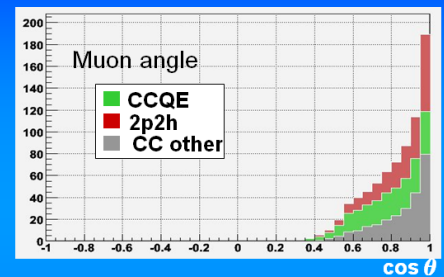

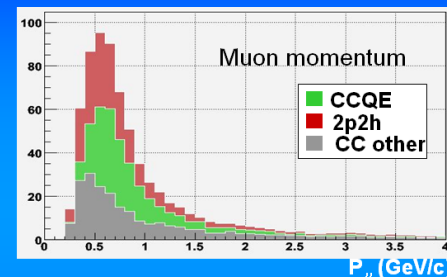

OA > 60°, CA > 150°

## CC $0\pi 2p$ event (2p2h enriched events)

Number of events  
(68kg water target,  $1.0 \times 10^{21}$  pot)

Already applied  $\mu$  angle acceptance  
and proton detection threshold

Selection will be optimized

Not only proton but also pion will be measured with low energy threshold.

# Schedule (E71)

Totally  $>1.0 \times 10^{21}$  pot @ 2 times exposure (E71a, b)

E71a ( $0.48 \times 10^{21}$  pot) ← Our first Physics Run

2020: Emulsion film scanning  
Time stamping  
Inclusive measurement

2021: Emulsion film scanning  
Time stamping  
Exclusive measurement  
(CCQE, 2p2h,  $1\pi$ )

2022:  $\nu_e$  measurement  
Event summarizing

E71b will be started from 2022 after J-PARC accelerator upgrade  
( $>0.5 \times 10^{21}$  pot)

# Summary

- Precise neutrino-water interactions is important for future neutrino oscillation analysis. (especially, **2p2h** and  $\nu_e$ )
- We are performing a neutrino experiments at J-PARC to study low energy neutrino - nucleus interactions by introducing nuclear emulsion (**NINJA Experiment**).
- Neutrino beam exposure for our first Physics Run (E71a) was completed in the middle of this Feb.
- We also plan to implement second Physics Run (E71b).
- We will start emulsion analysis soon.
- Discussion about contribution with nuclear emulsion for future neutrino physics is very welcome for us.
